EXECUTIVE SUMMARY

Environmental Resources Management Australia Pty Ltd (ERM) was commissioned by Country Regional Network John Holland Rail Pty Ltd (JHR) to undertake a Preliminary Site Investigation (PSI) with supplementary shallow soil assessment at the Bungendore Station, Majara Street, Bungendore NSW (the 'Site').

The Site is owned by Transport for NSW (TfNSW) via the Transport Assets Holding Entity (TAHE) and forms part of the broader Bungendore Rail Precinct. Management of the Site falls under Sydney Trains, however JHR have requested this PSI as part of their overarching management of lead issues at the Bungendore Rail Precinct. The PSI has been completed in parallel to a PSI on the Bungendore Rail Corridor and Sidings, which form part of the Country Rail Network (CRN). The works completed for the broader Bungendore Rail Corridor to date have focused on potential impacts related to the transport of lead ore by the rail line which passes adjacent to the Site.

The objectives of the PSI were to collect Site information that is sufficient to:

- *identify potential sources of contamination and determine potential contaminants of concern;*
- *identify areas of potential contamination;*
- *identify potential human and ecological receptors;*
- *identify potentially affected media; and*
- *assess the nature and extent of identified key contaminants (heavy metals) of potential concern in surface soils.*

Additionally, as required, the preliminary conceptual site model can be used to assess potential implications for notification to the New South Wales Environment Protection Authority (NSW EPA) under Section 60 of the Contaminated Land Management Act 1997 (CLM Act) and to assess and manage potential liabilities in relation to ongoing human health and/or environmental risks. In order to meet the objectives, the scope of work included desktop database searches and reviews and a site inspection which was supplemented with a limited shallow soil investigation.

The Site is zoned as Infrastructure (SP2) has been utilised for rail activities since 1885. Although a number of potentially contaminating activities may have occurred at the Site in association with the long term rail usage, the primary potentially contaminating activities historically undertaken onsite appear to be the transport of lead ore by the adjacent rail. Lead ore was historically transported via Bungendore within uncovered wagons from the Captains Flat Mine, located approximately 35 km to the south. Based on historical photograph review, it appears that rail infrastructure was historically present at the southern portion of the Site, however the purpose of the infrastructure is unconfirmed. A previous investigation undertaken by Rambol (2021) identified lead concentrations in surface soils at the Site which appeared to be related to historical lead ore transport and/or handling. The data collected by Rambol has been considered in the conclusions of this PSI.

The soil sampling completed as part of this preliminary investigation consisted of 15 shallow soil sampling locations applying a systematic sampling pattern and supplemented the historical data set. Results were screened against Tier 1 criteria which were selected based on the identified Site receptors.

Based on the data collected, concentrations of lead in shallow soils (<0.1 m bgl) are present above applicable screening criteria at a number of locations with the most elevated concentrations observed in the southern portion of the Site and in proximity to the rail line. Concentrations observed during this PSI exceeded recreational HILs at depths of 0.05 - 0.1 m bgl, however historical data (Rambol 2021) indicates concentrations in surface soils exceed commercial/industrial criteria. Concentrations immediately to the east of the former Stationmasters residence (in proximity to the rail line) exceed both residential and commercial/industrial criteria. However, concentrations appear to decrease rapidly with distance from the rail line.

Results obtained both as part of this investigation and the Rambol investigation demonstrated that the concentrations in the surface soils (0 - 0.05m bgl) were up to an order of magnitude higher than soils at 0.1m bgl, indicating that concentration may decrease rapidly with depth.

Through the works described herein and the development of a preliminary conceptual site model, ERM has undertaken an assessment of potential:

- *sources of contamination;*
- *potential contaminants of concern; and*
- *potential human and ecological receptors.*

From this assessment, ERM considers that a number of potentially complete Source – Pathway – Receptor (SPR) linkages may exist at the Site, including for onsite commercial/industrial and recreational users of the Site (rail patrons and other members of the public). It is noted that onsite risks could be managed through the implementation of appropriate institutional controls. A potential SPR linkage has been conservatively identified for the former Stationmasters residence based on previously collected data on the eastern boundary. The potential risk to offsite residences has not been confirmed through direct sampling on the property and there is evidence to suggest that concentrations may not extend to the residence. Additional potential SPR linkages may exist for offsite groundwater bore users and offsite ecological receptors, however these issues have not been comprehensively assessed through groundwater and surface water assessment at this time.

Based on the identified lead impact in surface soils at the Site, and the potentially complete SPR Linkages present, a duty to notify the NSW EPA under S.60 of the CLM Act (1997) is considered to have been triggered. As part of the notification process, it is recommended that the NSW EPA should be engaged to discuss whether additional data collection and further assessment of potentially complete SPR Linkages may be beneficial in the NSW EPA's assessment of the Site. This Site should be managed as part of the broader Bungendore Rail Precinct.

1. INTRODUCTION

Environmental Resources Management Australia Pty Ltd (ERM) was commissioned by John Holland Rail Pty Ltd (JHR) to undertake a Preliminary Site Investigation (PSI) with supplementary shallow soil assessment at the Bungendore Station, Majara Street, Bungendore NSW (the 'Site').

The Site is owned by Transport for NSW (TfNSW) via the Transport Assets Holding Entity (TAHE) and forms part of the broader Bungendore Rail Precinct. Management of the Site falls under Sydney Trains, however JHR have requested this PSI as part of their overarching management of lead issues at the Bungendore Rail Precinct.

A Site Location Map is provided as *Figure 1* of *Appendix A*.

1.1 Background

The Bombala Line which passes through the Bungendore Rail Corridor and adjacent to the Site, forms part of the CRN. The Bombala Line was historically linked with the Captains Flat Line to the south of Bungendore, which was used to transport lead ore from the Captains Flat mine, located approximately 35km to the south. The Bombala Line ceased to be used for goods traffic in 1989, however the Bungendore Rail Corridor remains an operational passenger line for Countrylink services between Sydney and Canberra (NSW State Heritage Inventory, 2021).

ERM recently completed a PSI (ERM 2021) for the portions of the Bungendore Rail Precinct included all lands in the Bungendore Rail Precinct that form part of the Country Rail Network (CRN). The PSI included extensive sampling of surface soils along the length of the rail corridor and associated sidings. The sampling identified lead concentrations in excess of landuse criteria and concluded that potentially complete Source Pathway Receptor (SPR) linkages may be present.

The Bungendore Station is adjacent to the areas of the Bungendore Rail Precinct where lead was identified in the PSI. A limited assessment was undertaken by Rambol on behalf of TfNSW in the vicinity of the Bungendore Station, which indicated that lead may be present at the Site.

This PSI is required to assist JHR and the landowner (TfNSW) understand whether the lead contamination extends to the Bungendore Station Site and potential risks to identified receptors, or whether any historical activities may have been undertaken at the Site which may have resulted in additional contamination.

1.2 Objectives

The objective of the PSI was to collect Site information sufficient to:

- assess potential sources of contamination and identify key potential contaminants of concern;
- assess areas of potential contamination;
- identify potential human and ecological receptors; and
- assess the nature and extent of identified key contaminants (heavy metals) of potential concern in surface soils.

This information will be used to develop a preliminary Conceptual Site Model (CSM), which provides a representation of site-related contamination sources, receptors and exposure pathways between these sources and receptors.

Additionally, as required, the preliminary CSM can be used to assess potential implications for notification to the NSW Environment Protection Authority (EPA) under Section 60 of the *Contaminated Land Management Act* (1997) (CLM Act) and to assess and manage potential liabilities in relation to ongoing human health and/or environmental risks.

1.3 Scope of Works

The PSI included a preliminary desktop review to collect basic site information and a site walkover, supplemented by shallow soil sampling. This information was used to develop the conceptual site model. Specific tasks associated with each stage of work are presented in the following subsections.

1.3.1 Desktop Searches and Review

An understanding of the Site and environmental setting is necessary for developing the conceptual site model, to do this the report has taken into consideration the following:

- Site description;
- Site activities (current and historic);
- Site history;
- geology;
- hydrogeology; and
- hydrology.

Review of background information relating to the Site, including:

- Historical land titles;
- Historical aerial photographs;
- Contaminated land register;
- Groundwater bore register;
- Environmental permit/license registers;
- Australian heritage databases; and
- Any historical investigation reports relating to contamination at the Site.

1.3.2 Site Visit Including Shallow Soil Sampling

Site investigation works comprised a detailed site walkover prior to the collection of shallow soil samples. This stage of works included the following tasks:

- health and safety preparation including:
  - review of “Dial Before You Dig”/service plans;
  - development of an overarching Health, Safety and Environment Plan;
  - consideration of a site-specific Sampling Analysis Plan (SAP);
- Site walkover to identify potential areas of environmental concern and to allow for necessary improvements in the investigation design;
- identification of key features, potential contamination sources and any areas where evidence of environmental impact associated with former site uses is present;
- collection of 15 primary shallow soil samples. Samples were collected on a combination of systematic and judgemental sampling design;
- each sample was collected from a depth of approximately 0.05 - 0.1 metres below ground level (m BGL) using hand tools;
- samples were submitted under chain of custody (COC) documentation to a National Association of Testing Authorities (NATA) accredited laboratory; and
- samples were analysed for heavy metals, which are considered the key contaminants of potential concern (COPCs) for the Site.

2. SITE IDENTIFICATION

2.1 Site Identification

The Site identification information is presented within Table 2-1 below:

Table 2-1: Site Identification

Item	Description
Site Owner	Transport for New South Wales
Site Occupier / Usage	Sydney Trains / Railway station
Site Address	Majara St, Bungendore, NSW, 2621
Legal Description	Part Lot 2 DP814518 & public infrastructure lands (railway station).
Current Zoning[1]	Infrastructure (SP2)
Site Perimeter[2]	720 m
Site Area[2]	15,170 m^2
Elevation[1]	700 m AHD
Site Location and Site Layout	Figures 1 - 2 Appendix A

[1] Data sourced from Queanbeyan-Palerang Regional Council (2021)

[2] Data sourced from https://maps.six.nsw.gov.au/

2.2 Site Description and Use

This Site is owned by TfNSW and managed by Sydney Trains as an active railway station. The Bungendore Station building is located on the central eastern boundary of the site which adjoins to the Bungendore Railway Corridor. The Site is relatively flat, covered with grass and contains several mature trees. The Station is accessed via Majara Street by a gravel road which passes through the centre of the Site. A carpark with gravel surface is located to at the southern portion of the Site. At the time of reporting, the southern car park was fenced off and not in use.

The eastern boundary of the Site is fenced to restrict access to the railway corridor, with the exception of the platform area. A heritage site, the former 'Stationmasters Residence' (Lot 1 DP814518), zoned as low density residential is located to the north of the Site, however is not included as part of this investigation.

The Site layout is illustrated in *Figure 2, Appendix A*. Further details regarding site observations made during the Site inspection are presented in *Section 4.*

2.3 Surrounding Land Use

The Site is predominately surrounded by low-density residential zoned and the rail corridor to the east. The key land use surrounding the Site are illustrated on *Figure 1, Appendix A* and are summarised below in Table 2-2:

Table 2-2: Surrounding Land Uses

Direction	Land use
North	Low density residential (R2) property bordering the north of the Site (former Stationmasters Residence), followed by the Queanbeyan Palerang Regional Council Chambers. Turallo Creek is located 320m to the north-east and is situated within a parcel of environmental conservation (E2) zoned land.
East	The Bungendore Rail Corridor zoned as Infrastructure (SP2), followed by Powell Street and low density residential (R2) properties beyond the rail corridor.
South	Kings Highway borders the south of the Site followed by rail infrastructure (SP2) land (Woolshed Siding).
West	Majara Street followed by a mixture of low density residential (R2), general residential (R1), infrastructure (SP2). The low density residential (R2) land across Majara Street from the Site is a public school.

Source: Quenbeyan-Palerang Regional Council (2021)

2.4 Desktop Regulatory Records Search

For the purpose of the desktop review of publically available regulatory information, Lotsearch was subcontracted to complete the searches. The information provided by Lotsearch was reviewed and assessed in the context of this PSI. A summary of the relevant background information is presented in the following subsections and is presented in full in *Appendix C*

2.4.1 Hazardous Chemicals Information

No bulk hazardous chemicals are currently stored at any Area of the Site. During the Site inspection (refer to *Section 4*) no indications of historical above or below ground fuel storage were observed. A search of the Dangerous Goods Register was not undertaken as part of this PSI due to the focus being primarily on heavy metals. The potential for use or storage of hazardous chemicals at the Site was also assessed through the review of available data retrieved from Geoscience Australia regarding liquid fuel storage and by aerial photograph analysis (See *Appendix C* and *Section 2.5.2*). The National Liquid Fuel Facilities databases did not indicate any instances of chemical storage onsite, although there are three bulk fuel storage facilities located in Bungendore (all petrol stations).

Based on review of historical aerial photographs, it is unlikely that the historical storage of bulk above ground hazardous chemicals occurred on the Site. Historical aerial photographs indicate that a structure in the Sites south-eastern extent was removed sometime between 1968 and 1976. It is unknown what this structure was used for, or what may have been stored there historically.

2.4.2 Regulatory Agency Search

Key findings from searches of NSW Environment Protection Authority (EPA) databases of Contaminated Sites, and of the National Waste Management Site database are presented below:

- The NSW EPA Contaminated Land List is a database of sites that have been notified to the NSW EPA under Section 60 of the CLM Act (1997) and are either under assessment or have been confirmed to present an immediate or long-term risk of harm to human health and/or the environment under the CLM Act and are currently under NSW EPA regulation. The register shows all current and former sites on the list in NSW. As presented in *Appendix C*, there is no portion of the Site identified on the register. A former timber treatment plant (located on the corner of King and Bulmaroo Streets) been classified as ‘contamination formerly regulated under the CLM Act’ exists approximately 550m south-east of the site;
- The National Waste Management Site database lists the locations of Australia’s known landfills, waste transfer stations and a large number of waste reprocessing facilities. As presented in *Appendix C*, the Site does not appear in this databased and there are no identified waste management site within a 1,000 m distance of the Site; and

- The NSW Protection of the Environment Operations (POEO) Act 1997 establishes a licensing and monitoring requirement for certain activities where there is a potential risk to the environmental if not managed appropriately. The Site is adjacent to a railway corridor listed on the POEO register under EPL 13421, which regulates the entire CRN for the operation of railway systems and activities. There are no other licensed activities under the POEO Act (1997) occurring within 1,000m of the Site.

2.4.3 Ecological Constraints

A search for Groundwater Dependant Ecosystems (GDEs) and Inflow Dependant Ecosystems (IDEs) identified Turallo Creek 277m north of the site as a 'high potential GDE' & 'high potential IDE'.

A search for Endangered and Vulnerable Species identified on the NSW BioNet Atlas database as potentially occurring within 10km of the site identified 35 species of flora or fauna that are either endangered or vulnerable, refer to *Appendix C* for a list of species. Considering the nature of the species listed, it is considered unlikely that the Site would form significant habitat for these species given the limited vegetation across the site and the location of the Site within the Bungendore Township.

2.4.4 Site History

A summary of the site history as interpreted from available background sources is presented in the following subsections.

2.4.5 Historical Potentially Contaminating Activities

Information obtained from JHR during the completion of the PSI confirmed that the Bombala Line adjacent to the Site was used to transport lead ore from the Captains Flat mine with likely uncovered wagons of unknown integrity.

2.4.6 Historical Aerial Photographs

Historical aerial photographs indicate that the site has been somewhat remodelled over time. A summary of observations made for each photograph is presented in *Table 2-3* below.

Table 2-3: Historical Aerial Photograph Summaries

Year	Description
1944	In 1944, the Site existed in a similar layout compared to 2021. The station buildings and station-masters' residence are present, along with the open drainage channel bordering the western extent of the site. An unknown structure exists in the south western corner of the Site. The road running through the Site is also present, entering in the northwest at Majara St and exiting at the south onto what is now the Kings Highway. The area immediately surrounding the Site is sparsely populated.
1959	The 1959 aerial photograph is very low resolution, however it appears as though there were minimal changes since 1944 with the exception of the construction of a few properties to the southeast of the Site.
1961	In 1961, further developments to the sites surrounds are observable, however it appears minimal changes have occurred on the Site itself.
1968	The 1968 aerial photograph displays further developments to the sites surrounds, however it appears minimal changes have occurred on the Site itself, with the exception of the land within the fenced area in the southeast of the Site appearing to be cleared.
1976	The 1976 photograph displays continued residential developments surrounding the Site. Onsite, the building and associated structures in the Sites south eastern extent have been removed completely.
1985	Residential developments around the Site have increased markedly, whilst the primary school is now evident west of Site. Roads surrounding the Site now also appear to be asphalted. Onsite, grass appears to have been cleared through the central north-western extent.

Year	Description
1992	Residential development has again continued in the Sites surrounds. Onsite, a walking track running the southern and western extents is now evident, along with two small bare patches just south of the station buildings.
1997	Residential developments again continue, and the school has expanded. Onsite, some vegetation is present, along with a walking track running through the centre of the Site. The station roof also appears to have been remodelled and replaced.
2002	Offsite, residential developments continue. Onsite, the dirt road running through the centre of site has been redirected to exit westward onto Majara St at the southern extent, rather than southwards onto the Kings Highway. Vegetation has also increased markedly.
2009	By 2009 the QPRC chambers are evident to the sites' north. Residential developments along with an expansion of the primary school have also occurred. Onsite, vegetation has increased further.
2015	Offsite, developments to the school and residences have continued. Onsite, vegetation has increased, and a new dirt walking track is evident in the Sites' south portion.
2021	Minimal changes occurred between 2015 and 2021 both on and offsite. It appears as though vegetation has increased marginally.

2.4.7 Heritage

Local and State Heritage

A review of the search results relating to state and local heritage items (*Appendix C*) found that the Site appears on the State Heritage Register, and is defined as part of the 'Bungendore Railway Station & Yard Group'. The 'Bungendore Railway and Yard Group' is also considered an item of local heritage.

A total of 67 further sites of local heritage exist within the 1000m buffer zone of the site (*Appendix C*). The heritage search also identified major additions and changes to the Bungendore rail precinct prior to the aerial photograph record. These included the installation of a 12-ton cart weighbridge (1891, removed at an unknown date), carriage shelter shed/engine shed (1902, relocated to Coffs Harbour in 1918), and loading bank (1909). The exact location of these features is unknown is has not been confirmed whether they were located at the Site or within the Bungendore Railway Precinct.

National and Commonwealth Heritage

Review of National and Commonwealth Heritage database listings (*Appendix C*) has not identified the Site as an item of natural, historic, or indigenous place of National or Commonwealth significance.

2.4.8 Title Deed Information

A review of heritage information (*Appendix C*) identified that the Site has been operated as a railway line since the railway station was opened in 1885. No historical title search was completed as part of this investigation as the heritage information is considered sufficient to determine that the Site history has not altered from rail use.

2.5 Summary of Previous Investigations

A limited assessment was undertaken by Rambol on behalf of TfNSW in the vicinity of the Bungendore Station and Queanbeyan Regional Council Chambers, which indicated that lead may be present in surface soils at the Site. Given the relevance of the Rambol investigation to the PSI, the text, tables and figures of the Rambol report have been included in *Appendix H*. The investigation included survey with X-Ray Fluorescence (XRF) which semi-quantitatively identified lead concentrations in shallow soils.

The Rambol Investigation focussed on superficial and shallow soils within the Bungendore Railway Station yard and rail corridor. Field measurements taken from surface soils at the Bungendore Station area also indicated that lead was present above land use criteria (commercial/industrial and recreational open space), in particular at the southern portion of the Station area, nearest to the Wool Shed (up to 10,770 mg/kg). Ramboll noted that concentrations appeared to decrease significantly at 0.1 m bgl when compared to those taken at surface, indicating that the primary lead impact may be present in surface soils.

3. ENVIRONMENTAL SETTING

The following description of the site's environmental setting is based on a site visit undertaken on 7 October 2021 and information provided in *Appendix C*, which was obtained from publically available databases and reference sources.

3.1 Local Topography and Hydrology

According to topographical information obtained from the Department of Finance, Services, and Innovation, presented in *Appendix C*, the Site is located at an elevation of approximately 700m AHD. The Site area is generally flat with the broader area surrounding the Site generally sloping gently from the south-east towards the north-west.

Stormwater and associated runoff is directed offsite through open drainage channels along the western site boundary towards Turallo Creek, to the north surface water is generally expected to either infiltrate directly through the soil profile or in sheet flow in a north-westerly direction.

3.2 Geology and Soils

According to the mapping units provided by the NSW Department of Industry, Resources and Energy and presented in *Appendix C,* the Site is underlain by a turbiditic sequence of sandstone, mudstone, shale, quartzite, quartz phillite, phyllite, and slate.

Soils observed on the Site were variable, with varying degrees of fill noticed throughout. Soils mostly consisted of silt and sand mixtures with varying degrees of gravels. Ballast-like gravels and sandy fill was noticed in the sites southern extent, whilst blueish grey fill was noticed in the sites most northern portion.

The Atlas of Australian Acid Sulfate Soils maps, as presented in *Appendix C*, shows that the site contains of sodosol soils, with a 'Low (6% - 70%)' probability of occurrence of acid sulfate soils.

3.3 Hydrogeology

A review of the groundwater bore information presented in *Appendix C* identified 68 boreholes within a 1,000 m radius of the Site. The seven bores located within 500m are shown in *Appendix C*. These bores are GW403783 (124m east), GW402023 (159m east), GW404621 (326m east), GW416600 (337 north-east), GW404164 (444m north-east), GW025806 (482m east), and GW403817 (498m north west. Six of the seven nearest bores located within 500m of the site are registered for domestic use. The other is monitoring bore 416600, which was installed in 2015 and is located 337m to the north east of Site. It was installed to 5.1 m bgl, and has a recorded standing water level of 4.35 m bgl.

The water supply for the township of Bungendore is via municipal extraction bores and therefore it is assumed that the bores within close proximity to the Site may be potable and are potentially used for drinking purposes. Depth to groundwater and groundwater flow direction at the Site has not been confirmed through the installation of groundwater monitoring wells. However, based on the location of Turallo Creek, and the local topography, it is anticipated that groundwater would generally flow in a north to north-west direction, towards the creek. It is important to note that groundwater flow direction can be influenced locally and regionally by not only surface topography, but recharge and discharge areas, horizontal and vertical inconsistencies in the types, location and orientation of subsurface soils, fill or bedrock and proximity to groundwater extraction wells.

4. SITE INSPECTION

4.1 General

A Site inspection was conducted by ERM on 7 October 2021. The overall purpose of the site inspection was to gather information and consolidate the findings of the desktop review through physical inspection of contaminant sources, pathways and receptors as an assessment of surface (and potential subsurface) Site conditions. Observations made during the Site Inspection were used for the description of the current Site layout and usage is presented in *Section 2.2*. The following section details information gathered at the time of the Site visit. A photographic log is provided in *Appendix F*.

4.2 Site Observations

Key observations noted during the site inspection and soil sampling included:

- The Bungendore railway station is located at the central eastern portion of the Site and consists of four separate buildings. The buildings paintwork appears to be well maintained. Renovations were underway on the toilet block, to the south of the platform. There was no evidence of the removed structures noted in the Sites' southeast during the aerial photograph review;
- The former 'Stationmasters Residence' borders the Site to the north, with the rail corridor forming the eastern boundary. The residences' southern fence was covered with flaking paint;
- A compacted dirt driveway enters from Majara street and arcs from the northwest of the site across to the station and around to the southwest where it re-joins Majara street;
- The carpark at the southern portion of the Site was inaccessible to the public, secured by temporary fencing;
- The Site was generally well vegetated with grasses, large gum trees, and smaller shrubs in raised beds;
- Bare patches were noted amongst grassed areas across the site, particularly towards the car parking area, and towards the northeast of the site. Grass was also longer, although patchy towards the southern extent of the site;
- A vegetated open storm-water channel runs south to north along the western boundary of the site;
- Pooling water was intermittently present to the immediate east of the storm-water channel; and

Soils on the Site were somewhat consistent, with varying degrees of fill noticed throughout. Ballast-like gravels and sandy fill was noticed in the sites southern extent whilst blueish grey fill was noted in the north.

5. PRELIMINARY SHALLOW SOIL SAMPLING

5.1 General

Following the Site inspection, a limited shallow soil sampling investigation was undertaken on 7-8 October 2021. All works were conducted in general accordance with ERM Proposal (P0612302) and ERM Standard Operating Procedures (SOPs).

5.2 Data Quality Objectives

Data quality objectives (DQOs) were developed to define the type and quality of data required to achieve the project objectives outlined in Section 1.2.

The DQOs have been prepared in line with the seven-step approach outlined in *National Environment Protection (Assessment of Site Contamination) Measure (the ASC NEPM)* (NEPC, 1999) (as amended 2013), and with reference to the NSW EPA (1997) *Contaminated Land Management* Act (CLM Act).

The seven steps of the DQO process, and how they were applied to this Preliminary Shallow Soil Sampling, are presented in the *Appendix D*. The DQO process is validated, in part, by the quality assurance and quality control (QA/QC) procedures and assessment presented in *Appendix E* of this report.

5.3 Contaminants of Concern

Based on the initial desktop review and observations made during the Site Inspection the key contaminants of concern for the Site are heavy metals (in particular lead), due to the historical transport of lead ore along the Rail Line by uncovered wagons of unknown integrity.

Additionally, based on the extensive historical use of the Site as a railway precinct and the limited understanding of the historical practices undertaken, a broad suite of COPCs may also considered relevant, including;

- Total Recoverable Hydrocarbons (TRH);
- Benzene, Toluene, Ethylbenzene and Xylenes (BTEX);
- Polycyclic Aromatic Hydrocarbons (PAHs);
- Phenols;
- Organochlorine and Organophosphate (OC/OP) pesticides; and
- Asbestos.

Although a wide range of COPCs have been identified, heavy metals were focused on for the shallow sampling. Additional COPCs should be considered for subsequent scopes of work.

5.4 Rationale for Sampling Design

The primary potentially contaminating activity historically undertaken associated with the investigation area was the transport of lead ore by rail. It is possible that dust from wagons and potential spills along the adjacent rail line have resulted in the presence of heavy metals such as lead.

Given the preliminary nature of the investigation, soil sampling design and spread were focused upon gaining a comprehensive and representative understanding of the condition of surface soils. Surface soil samples at the Site were sampled on a ~25m herringbone grid pattern. Sampling locations are illustrated in *Figure 1, Appendix A*.

The sampling was designed to provide an initial assessment of potential soil contamination issues to the extent practicable and is considered appropriate for the purposes of this report. Assessment of soils deeper than 0.1m bgl and groundwater was not included within the sampling design.

The analytical suite for soil samples focused on only the key COPCs, including 15 heavy metals (arsenic, boron, barium, beryllium, cadmium, chromium, cobalt, copper, manganese, nickel, lead, selenium, vanadium, zinc and mercury).

5.5 Soil Sampling Method

A total of 15 surface soil samples were collected. The following methodology was adopted as part of the soil sampling activities:

- investigation locations were sampled using a trowel or collected directly by hand to a depth of 0.1m bgl;
- soils at each location were logged by an experienced environmental scientist with any evidence of potential contamination noted if observed;
- a single soil sample was collected from each location into laboratory supplied jars which were sealed, appropriately labelled, and place in a cooler on ice for transport to the laboratory; and
- to reduce the potential for cross contamination between sampling locations, nitrile gloves were changed between the collection of each sample and non-disposable investigation equipment was decontaminated prior to the commencement of each location.

5.6 Soil Observations

During the fieldwork sampling program, the following observations were made during soil sampling:

- Soils were somewhat consistent across the majority of the Site, mostly consisting of silt and sand mixtures with varying degrees of gravels;
- Natural and fill soils were approximately equally distributed across site;
- A superficial blue/grey fill layer to 0.05m bgl was observed at the northernmost sampling point;
- Fill layers were generally more compact and contained greater proportions of gravels and sands when compared to the natural siltier soils; and
- No noticeable staining or odours were noted in materials were observed across the Site.

Field descriptions of each of the samples collected are provided in *Table 3, Appendix B.*

5.7 Laboratory Analysis

The laboratory used for the investigation was accredited by the National Association of Testing Authorities (NATA), Australia. The primary laboratory used for soil analysis, including intra-laboratory duplicate samples, was Australian Laboratory Services (ALS). The secondary laboratory used for the analysis of inter-laboratory duplicate samples was NATA accredited Eurofins. The analytical methods used by each laboratory are provided in the laboratory certificates provided as *Appendix G*.

All samples were analysed for the suite of heavy metals listed in Section 5.4.

5.8 Waste

No soil waste was generated as a result of soil sampling activities, and each investigation location was backfilled using the soil cuttings removed and surrounding surface materials. General waste associated with disposable sampling equipment (e.g. gloves and glass sample jars) was removed from the Site and disposed off-site appropriately as general waste.

5.9 Soil Screening Criteria

The Tier 1 screening criteria for soil data has been selected based on a review of the ASC NEPM (2013 update): Schedule B1: Guideline on the Investigation Levels for Soil and Groundwater. Health Investigation Levels (HILs) for human health – direct contact and Ecological Investigation Levels (EIL's) were applied. Given the broad area of investigation, criteria for various land uses were applied based on the identified Site receptors as described in *Section 6.5*. The Screening Criteria were applied as follows:

- Commercial/Industrial (HIL D and EIL) - all samples were screened against commercial/industrial criteria, due to the Sites' proximity to the rail corridor and the ongoing restoration works being undertaken on Site;
- Open Space/ Recreation (HIL-C) – all samples were screened against HIL C criteria due to the degree of community access to the site; and
- Residential (HIL A) and EIL (Urban Residential & Open Space) – selected samples that were located on the Sites boundaries were additionally screened against residential criteria as an indication of whether any offsite risks may be plausible.

In order to nominate an appropriate EIL for certain analytes, Site specific data for certain parameters is necessary. The specific data is not available, and therefore conservative assumptions have been made based on Site observations. A low clay content of 1% was used based on the silty gravelly soil observed onsite. Conservative values of 5 pH and 10 cmol/kg Cation Exchange Capacity (CEC) were adopted. The EILs also make an allowance for a background level of a certain contaminant to be present and the background concentration is added to the screening level. Concentrations observed at un-impacted areas of the Bungendore Rail Precinct (Trucking Yard) (ERM, 2021) were used to represent background conditions. An average of these samples was calculated and added to the Added Contaminant Limit (ACL) as specified in NEPM (2013).

The screening criteria are summarised in the header portion of the analytical results *Table 4, Appendix B*.

5.10 Soil Analytical Results

A total of 15 primary soil samples were analysed for heavy metals. A summary of analytical data that has applied the relevant screening criteria is presented in *Table 4, Appendix B*. Laboratory certificates of analysis are provided in *Appendix H*. Exceedances of screening criteria are illustrated in *Figure 3, Appendix A* and are summarised in Table 5-1 below.

Table 5-1: Soil Exceedances

Analyte	Applicable Primary Samples	Concentration (mg/kg)	Criteria Exceeded
Lead	SS-STN-01	978	■ NEPM 2013 Table 1A(1) HILs Res A Soil ■ NEPM 2013 Table 1A(1) HILs Rec C Soil
	SS-STN-02	680	■ NEPM 2013 Table 1A(1) HILs Res A Soil ■ NEPM 2013 Table 1A(1) HILs Rec C Soil
	SS-STN-13	515	■ NEPM 2013 Table 1A(1) HILs Rec C Soil

Given that lead is the primary COPC for the Site on the basis of the primary contaminating activities involving movements of lead ore, a concentration map which uses the observed concentrations of lead to estimate potential concentrations across the Site has been included as *Figure 4, Appendix A.*

5.11 Quality Assurance / Quality Control Evaluation

A detailed QA/QC report including field procedures, laboratory methods and an analysis of QA/QC results from the investigation is provided in *Appendix E*.

In summary, field and laboratory QA/QC data were reported generally free of systematic and method biases and were assessed to be of sufficient quality for the purposes of this investigation. Any outliers are discussed in *Appendix E.*

6. PRELIMINARY CONCEPTUAL SITE MODEL

An understanding of potential exposure scenarios is necessary to evaluate the suitability of a site for a particular land use, being the current approved or potential future land use. Potential exposure pathways are evaluated for completeness based on the existence of:

- a source of contamination/impact;
- a mechanism for release of contaminants from identified sources;
- a contaminant retention or transport medium (e.g. soil, air, groundwater, etc.);
- potential receptors of contamination; and
- a mechanism for chemical intake by the receptors at the point of exposure.

Whenever one or more of the above elements is missing, the source/pathway/receptor linkage is incomplete and there is therefore there can be no risk to the identified receptor.

6.1 Potential Sources of Contamination

The current and historic potential sources of on and off-site soil contamination identified through this PSI which are considered to represent a potential environmental liability include the following:

- **Historical handling of lead ore:** the operation of the rail infrastructure immediately adjacent to the Site represents a potential contamination source with respect to potential lead ore spillage and dust from cargoes and their deposition throughout the corridor.
- **Stockpiling of potential contaminated soils:** neighbouring rail sidings including the Woolshed 100m south of site have historically been used for stockpiling potentially contaminating materials. There is a possibility that similar stockpiling occurred historically on Site.
- **Use of lead based paint on structures:** heritage structures are known to have commonly been painted with lead based paints, which can enter soils within the dilapidation footprint.
- **Historical operation of railway lands (various):** the Bungendore Rail Precincts long term use as rail yards may have resulted in a number of additional contaminating activities which were not readily observable during the Site Inspections including (but not limited to) pesticide use, hydrocarbon spills, potential historical hydrocarbon storage, use of contaminated building materials (asbestos), use of PCB oils and potential historical onsite fires.

6.2 Nature and Extent of Impact

The primary COPC for the Site is lead, based on the historical movements of lead ore through the rail corridor adjacent to the Site. Investigations within the rail corridor (ERM 2021a) have indicated that higher lead concentrations are present within rail ballast and areas where lead ore was handled, however decreases significantly with distance from the rail lines.

Previous investigations (Rambol, 2021) at the Site have assessed shallow soils, although have focussed only upon concentrations at the ground surface and upper 0.1m of the soil profile. Results obtained by Rambol have indicated lead concentrations of up to 10,770 mg/kg in the surface soils on Site. Concentrations are appearing to be most elevated at the southern portion of the Site, where until recently a public car parking area was located (now restricted access). It is noted that this is the general area where unknown historical structures were located, however the purpose of the structures has not been confirmed.

Lead concentrations in surface soil proximity to the former stationmasters' residence (currently the nearest residential receptor to the Site), indicated that concentrations immediately to the east of the residence (within the rail corridor) are in excess of both residential and commercial/industrial criteria.

However, concentrations appear to decrease rapidly with distance from the rail corridor and concentrations observed to the south and west of the residence were below residential criteria. Lead concentrations along the western Site boundary were also below all screening criteria, indicating that the lead concentrations in surface soils observed onsite may not extend offsite to the west.

Results obtained both as part of this investigation and the Rambol investigation demonstrated that the concentrations in the surface soils (0-0.05m bgl) were up to an order of magnitude higher than soils at 0.1m bgl. Samples collected during this investigation were collected from 0.05-0.1m bgl and were therefore lower than the concentrations observed by Rambol.

The observed distribution of the lead concentrations observed has been mapped in *Figure 4, Appendix A*.

6.3 Potential Pathways

The primary potential exposure pathways of concern at the site are:

- Dermal contact and / or incidental ingestion with impacted soils / sediments, surface water);
- Home grown produce (residential only);
- Inhalation of dust (from impacted soils);
- Contact with groundwater via abstraction bores; and
- Inhalation of vapours (volatile constituents only).

6.4 Potential Receptors

The following potential receptors have been identified relevant to the site:

Human Receptors:

- On/off-site commercial/industrial workers;
- Rail Patrons/Users of the Bungendore Station (recreational setting);
- Off-site residents;
- Users of Bungendore Public School; and
- Potential users of groundwater.

Ecological Receptors:

- On and off-site terrestrial receptors.

6.5 Qualitative Evaluation of Environmental Risk

6.5.1 Onsite Human Health

The primary Site receptors are considered to be on-site commercial/industrial rail workers and members of the public who use the Railway Station for rail transport purposes. Members of the public are also considered relevant receptors who use the carpark on Site for alternative purposes such as for pick-up/drop off of students for Bungendore Public School. The path for both commercial / industrial and rail patrons/members of the public using the Bungendore Station (recreational setting) is by direct contact with impacted soils. This SPR linkage is considered to be potentially complete.

Dust inhalation is considered to be a potential SPR linkage for both commercial / industrial and rail patrons/members of the public using the Bungendore Station, particularly given that lead is present in surface soils. Any dust generation would be highly incidental given grass coverage is present across the most of the Site, however physical disturbance through vehicle access to impacted areas and climactic conditions would influence levels of dust generation at the Site.

The potential for contamination to have migrated to onsite groundwater has not been assessed, however given the depth of groundwater (likely approximately 7m), it is unlikely that onsite receptors would contact groundwater. No significant sources of volatile contaminants has been identified and therefore vapours inhalation is unlikely to represent a likely exposure pathway.

6.5.2 Off-site Human Health

A number of registered domestic groundwater bores exist in close proximity to the Site. Groundwater has not been assessed as part of this PSI, and although lead concentrations appear to decrease significantly with depth, the data collected is not sufficient to conclude that vertical delineation has been achieved. Potential exists for lead to have mobilised vertically to groundwater and caused a plume which extends to the offsite bores.

6.5.3 On-site Ecological

Exceedances of ecologically based criteria were noted for a number of heavy metals across the Site (primarily based on Rambol 2021). Whilst is possible that the fauna may access the Site, it is recognised that the Site is not intended to be supportive of ecological communities. Mature trees are present onsite which do not appear stressed. Grass coverage is inconsistent and may be impacted by lead concentrations in surface soils. Based on the concentrations present, the Site may not support shallow rooting or sensitive flora.

6.5.4 Off-site Ecological

It is considered a possibility that identified lead concentrations in shallow soil may mobilise in surface water runoff during rainfall and could migrate offsite into drainage channels which connect to offsite surface water receptors such as Turallo Creek. Offsite surface water has not been assessed as part of this PSI, and as such a potential SPR linkage cannot be excluded from further consideration.

6.6 Potentially Complete Exposure Pathways

A Source-Pathway-Receptor (SPR) linkage is considered to be present when a pathway links a source with a receptor. These linkages explain when there may be risks to the receptor, either now or in future. Based on information reviewed as part of this PSI, the following potentially complete SPR linkages currently exist:

- Onsite commercial / industrial worker through direct contact and/or dust inhalation. This risk may be managed through institutional controls;
- Onsite recreational users (rail patrons/ and/or members of the public using the Bungendore Station) through direct contact and/or dust inhalation. This risk may be managed by further restricting access to impacted areas of the Site;
- Offsite residential through direct contact and/or dust inhalation. Based on the close proximity of the stationmasters' residence to concentrations in excess of screening criteria, lead concentrations may extend to residential receptors;
- Offsite abstraction bore users if lead is present in groundwater and extends to offsite domestic bores;
- Onsite Ecological: Based on the concentrations present, the Site may not support shallow rooting or sensitive flora; and
- Offsite ecological receptors in surface water, noting the surface water has not been assessed as part of this PSI.

It is noted that in some cases the existence of potentially complete SPR linkages is based on incomplete data. The risk to receptors may be further quantified if additional relevant data was obtained.

7. CONCLUSIONS

Based on the results of the investigation works completed for the Site and reported upon within this PSI report, the overall objectives are considered to have been met and a preliminary understanding of potential sources of contamination, receptors and potential exposure pathways has been established.

The Site is zoned as Infrastructure (SP2) has been utilised for rail activities since 1885. The primary potentially contaminating activity identified was the historical use of the adjacent rail corridor/active railway transporting lead ore via uncovered wagons from the Captains Flat Mine. Based on the background information reviewed, a number of additional potentially contaminating historical activities have been identified relating to the long term railway use of the Site.

A previous investigation undertaken by Rambol (2021) identified lead concentrations in surface soils at the Site which appeared to be related to historical lead ore transport and/or handling. The data collected by Rambol has been considered in the conclusions of this PSI.

Soil sampling completed as part of this preliminary investigation focused on heavy metals in shallow soils (<0.1m bgl). The data was used along with the Rambol 2021 data to provide additional on the impact of historical lead ore transport/handling in the adjacent corridor. Based on the data collected, concentrations of lead in shallow soils (<0.1 m bgl) were present above applicable screening criteria at a number of locations. The distribution of lead in shallow soils at the Site can be summarised as follows:

- Lead concentrations in soil appear to be elevated in soils, with most elevated concentrations observed in the southern portion of the Site and in proximity to the rail line;
- Concentrations observed during this PSI exceeded recreational HILs at depths of 0.05-0.1 m bgl, however historical data (Rambol 2021) indicates concentrations in surface soils exceed commercial/industrial criteria and concentrations decrease rapidly with depth;
- Concentrations immediately to the east of the former Stationmasters residence (in proximity to the rail line) exceed both residential and commercial/industrial criteria. However, concentrations appear to decrease rapidly with distance from the rail line; and
- Results obtained both as part of this investigation and the Rambol investigation demonstrated that the concentrations in the surface soils (0-0.05m bgl) were up to an order of magnitude higher than soils at 0.1m bgl, indicating that concentration may decrease rapidly with depth.

Through the development of a preliminary Conceptual Site Model ERM have concluded that that a number of potentially complete SPR linkages at the Site relating specifically to lead. These are considered potential as further assessment is required in order to confirm if a potential risk exists. The identified potential SPR linkages include:

- Onsite commercial / industrial worker through direct contact and/or dust inhalation. This risk may be managed through institutional controls;
- Onsite recreational users (rail patrons/members of the public using the Bungendore Station) through direct contact and/or dust inhalation. This risk may be managed by further restricting access to impacted areas of the Site;
- Offsite residential through direct contact and/or dust inhalation.
  - This is based on the close proximity of the stationmasters' residence to concentrations in excess of screening criteria to the east (towards the rail line), however there is evidence to suggest that concentrations do not extend a significant distance from the rail line in this area and may not extent to the residence;
- Offsite abstraction bore users if lead is present in groundwater and extends to offsite domestic bores;
- Onsite Ecological: Based on the concentrations present, the Site may not support shallow rooting or sensitive flora; and

- Offsite ecological receptors in surface water, noting the surface water has not been assessed as part of this PSI.

Based on the identified lead impact in surface soils at the Site, and the potentially complete SPR Linkages present, a duty to notify the NSW EPA under S.60 of the CLM Act (1997) is considered to have been triggered. As part of the notification process, it is recommended that the NSW EPA should be engaged to discuss whether additional data collection and further assessment of potentially complete SPR Linkages may be beneficial in the NSW EPA's assessment of the Site. This Site should be managed as part of the broader Bungendore Rail Precinct.

8. STATEMENT OF LIMITATIONS

This report was prepared in accordance with the scope of work outlined within this report and subject to the applicable cost, time and other constraints. ERM performed the services in a manner consistent with the normal level of care and expertise exercised by members of the environmental profession. ERM makes no warranty concerning the suitability of the site for any purpose or the permissibility of any use, development or re-development of the site. Except as otherwise stated, ERM's assessment is limited strictly to identifying specified environmental conditions associated with the subject site and does not evaluate structural conditions of any buildings on the subject site. Lack of identification in the report of any hazardous or toxic materials on the subject site should not be interpreted as a guarantee that such materials do not exist on the site.

This assessment is based on site inspection conducted by ERM personnel, sampling and analyses described in the report, and information provided by John Holland Rail Pty Ltd ('JHR' or 'the client') or other people with knowledge of the site conditions. All conclusions and recommendations made in the report are the professional opinions of the ERM personnel involved with the project and, while normal checking of the accuracy of data has been conducted, ERM assumes no responsibility or liability for errors in data obtained from such sources, regulatory agencies or any other external sources, nor from occurrences outside the scope of this project.

ERM is not engaged in environmental consulting and reporting for the purpose of advertising, sales promoting, or endorsement of any client interests, including raising investment capital, recommending investment decisions, or other publicity or investment purposes.

ERM PREPARED THIS REPORT FOR THE SOLE AND EXCLUSIVE BENEFIT AND USE OF JHR. NOTWITHSTANDING DELIVERY OF THIS REPORT BY ERM OR JHR TO ANY THIRD PARTY, UNLESS OTHERWISE EXPRESSLY AGREED, ANY COPY OF THIS REPORT PROVIDED TO A THIRD PARTY IS PROVIDED FOR INFORMATIONAL PURPOSES ONLY, WITHOUT THE RIGHT TO RELY AND ERM DISCLAIMS ALL LIABILITY TO SUCH THIRD PARTY TO THE EXTENT PERMITTED BY LAW. ANY USE OF THIS REPORT BY A THIRD PARTY IS DEEMED TO CONSTITUTE ACCEPTANCE OF THIS LIMITATION.

Contaminated Land

Bungendore Railway Station, Bungendore, NSW 2621

List of NSW contaminated sites notified to EPA

Records from the NSW EPA Contaminated Land list within the dataset buffer:

Map Id	Site	Address	Suburb	Activity	Management Class	Status	Location Confidence	Dist	Direction
205	Former Timber Treatment Plant	Corner King Street and Butmaroo Street	Bungendore	Other Industry	Contamination formerly regulated under the CLM Act	Current EPA List	Premise Match	454m	South

The values within the EPA site management class in the table above, are given more detailed explanations in the table below:

EPA site management class	Explanation
Contamination being managed via the planning process (EP&A Act)	The EPA has completed an assessment of the contamination and decided that the contamination is significant enough to warrant regulation. The contamination of this site is managed by the consent authority under the Environmental Planning and Assessment Act 1979 (EP&A Act) planning approval process, with EPA involvement as necessary to ensure significant contamination is adequately addressed. The consent authority is typically a local council or the Department of Planning and Environment.
Contamination currently regulated under CLM Act	The EPA has completed an assessment of the contamination and decided that the contamination is significant enough to warrant regulation under the Contaminated Land Management Act 1997 (CLM Act). Management of the contamination is regulated by the EPA under the CLM Act. Regulatory notices are available on the EPA's Contaminated Land Public Record of Notices.
Contamination currently regulated under POEO Act	The EPA has completed an assessment of the contamination and decided that the contamination is significant enough to warrant regulation. Management of the contamination is regulated under the Protection of the Environment Operations Act 1997 (POEO Act). The EPA's regulatory actions under the POEO Act are available on the POEO public register.
Contamination formerly regulated under the CLM Act	The EPA has determined that the contamination is no longer significant enough to warrant regulation under the Contaminated Land Management Act 1997 (CLM Act). The contamination was addressed under the CLM Act.
Contamination formerly regulated under the POEO Act	The EPA has determined that the contamination is no longer significant enough to warrant regulation. The contamination was addressed under the Protection of the Environment Operations Act 1997 (POEO Act).
Contamination was addressed via the planning process (EP&A Act)	The EPA has determined that the contamination is no longer significant enough to warrant regulation. The contamination was addressed by the appropriate consent authority via the planning process under the Environmental Planning and Assessment Act 1979 (EP&A Act).
Ongoing maintenance required to manage residual contamination (CLM Act)	The EPA has determined that ongoing maintenance, under the Contaminated Land Management Act 1997 (CLM Act), is required to manage the residual contamination. Regulatory notices under the CLM Act are available on the EPA's Contaminated Land Public Record of Notices.
Regulation being finalised	The EPA has completed an assessment of the contamination and decided that the contamination is significant enough to warrant regulation under the Contaminated Land Management Act 1997. A regulatory approach is being finalised.
Regulation under the CLM Act not required	The EPA has completed an assessment of the contamination and decided that regulation under the Contaminated Land Management Act 1997 is not required.
Under assessment	The contamination is being assessed by the EPA to determine whether regulation is required. The EPA may require further information to complete the assessment. For example, the completion of management actions regulated under the planning process or Protection of the Environment Operations Act 1997. Alternatively, the EPA may require information via a notice issued under s77 of the Contaminated Land Management Act 1997 or issue a Preliminary Investigation Order.

NSW EPA Contaminated Land List Data Source: Environment Protection Authority

Contaminated Land

Bungendore Railway Station, Bungendore, NSW 2621

Contaminated Land: Records of Notice

Record of Notices within the dataset buffer:

Map Id	Name	Address	Suburb	Notices	Area No	Location Confidence	Distance	Direction
51	Former Timber Treatment Plant	Corner King Street and Butmaroo Street	Bungendore	1 former	990	Premise Match	454m	South

Contaminated Land Records of Notice Data Source: Environment Protection Authority

Former Gasworks

Former Gasworks within the dataset buffer:

Map Id	Location	Council	Further Info	Location Confidence	Distance	Direction
N/A	No records in buffer					

Former Gasworks Data Source: Environment Protection Authority

Waste Management & Liquid Fuel Facilities

Bungendore Railway Station, Bungendore, NSW 2621

Waste Management & Liquid Fuel Facilities

Bungendore Railway Station, Bungendore, NSW 2621

National Waste Management Site Database

Sites on the National Waste Management Site Database within the dataset buffer:

Site Id	Owner	Name	Address	Suburb	Class	Landfill	Reprocess	Transfer	Comments	Loc Conf	Dist	Direction
N/A	No records in buffer											

National Liquid Fuel Facilities

National Liquid Fuel Facilties within the dataset buffer:

Map Id	Owner	Name	Address	Suburb	Class	Operational Status	Operator	Revision Date	Loc Conf	Dist	Direction
4202	Caltex	Caltex Bungendore	42-44 Malbon Street	Bungendore	Petrol Station	Operational		25/07/2011	Premise Match	248m	West
3483	Independent Fuel Supplies	BP Bungendore	1 Gibraltar Street	Bungendore	Petrol Station	Operational		25/07/2011	Premise Match	642m	West
4077	Independent Fuel Supplies	Independent Bungendore	2 Gibraltar Street	Bungendore	Petrol Station	Operational		25/07/2011	Premise Match	665m	West

PFAS Investigation & Management Programs

Bungendore Railway Station, Bungendore, NSW 2621

EPA PFAS Investigation Program

Sites that are part of the EPA PFAS investigation program, within the dataset buffer:

Map ID	Site	Address	Loc Conf	Dist	Dir
N/A	No records in buffer				

EPA PFAS Investigation Program: Environment Protection Authority

Defence PFAS Investigation Program

Sites being investigated by the Department of Defence for PFAS contamination within the dataset buffer:

Map ID	Base Name	Address	Loc Conf	Dist	Dir
N/A	No records in buffer				

Defence PFAS Investigation Program Data Custodian: Department of Defence, Australian Government

Defence PFAS Management Program

Sites being managed by the Department of Defence for PFAS contamination within the dataset buffer:

Map ID	Base Name	Address	Loc Conf	Dist	Dir
N/A	No records in buffer				

Defence PFAS Management Program Data Custodian: Department of Defence, Australian Government

Airservices Australia National PFAS Management Program

Sites being investigated or managed by Airservices Australia for PFAS contamination within the dataset buffer:

Map ID	Site Name	Impacts	Loc Conf	Dist	Dir
N/A	No records in buffer				

Airservices Australia National PFAS Management Program Data Custodian: Airservices Australia

Defence Sites

Bungendore Railway Station, Bungendore, NSW 2621

Defence 3 Year Regional Contamination Investigation Program

Sites which have been assessed as part of the Defence 3 Year Regional Contamination Investigation Program within the dataset buffer:

Property ID	Base Name	Address	Known Contamination	Loc Conf	Dist	Dir
N/A	No records in buffer					

Defence 3 Year Regional Contamination Investigation Program, Data Custodian: Department of Defence, Australian Government

EPA Other Sites with Contamination Issues

Bungendore Railway Station, Bungendore, NSW 2621

EPA Other Sites with Contamination Issues

This dataset contains other sites identified on the EPA website as having contamination issues. This dataset currently includes:

- James Hardie asbestos manufacturing and waste disposal sites
- Radiological investigation sites in Hunter's Hill
- Pasminco Lead Abatement Strategy Area

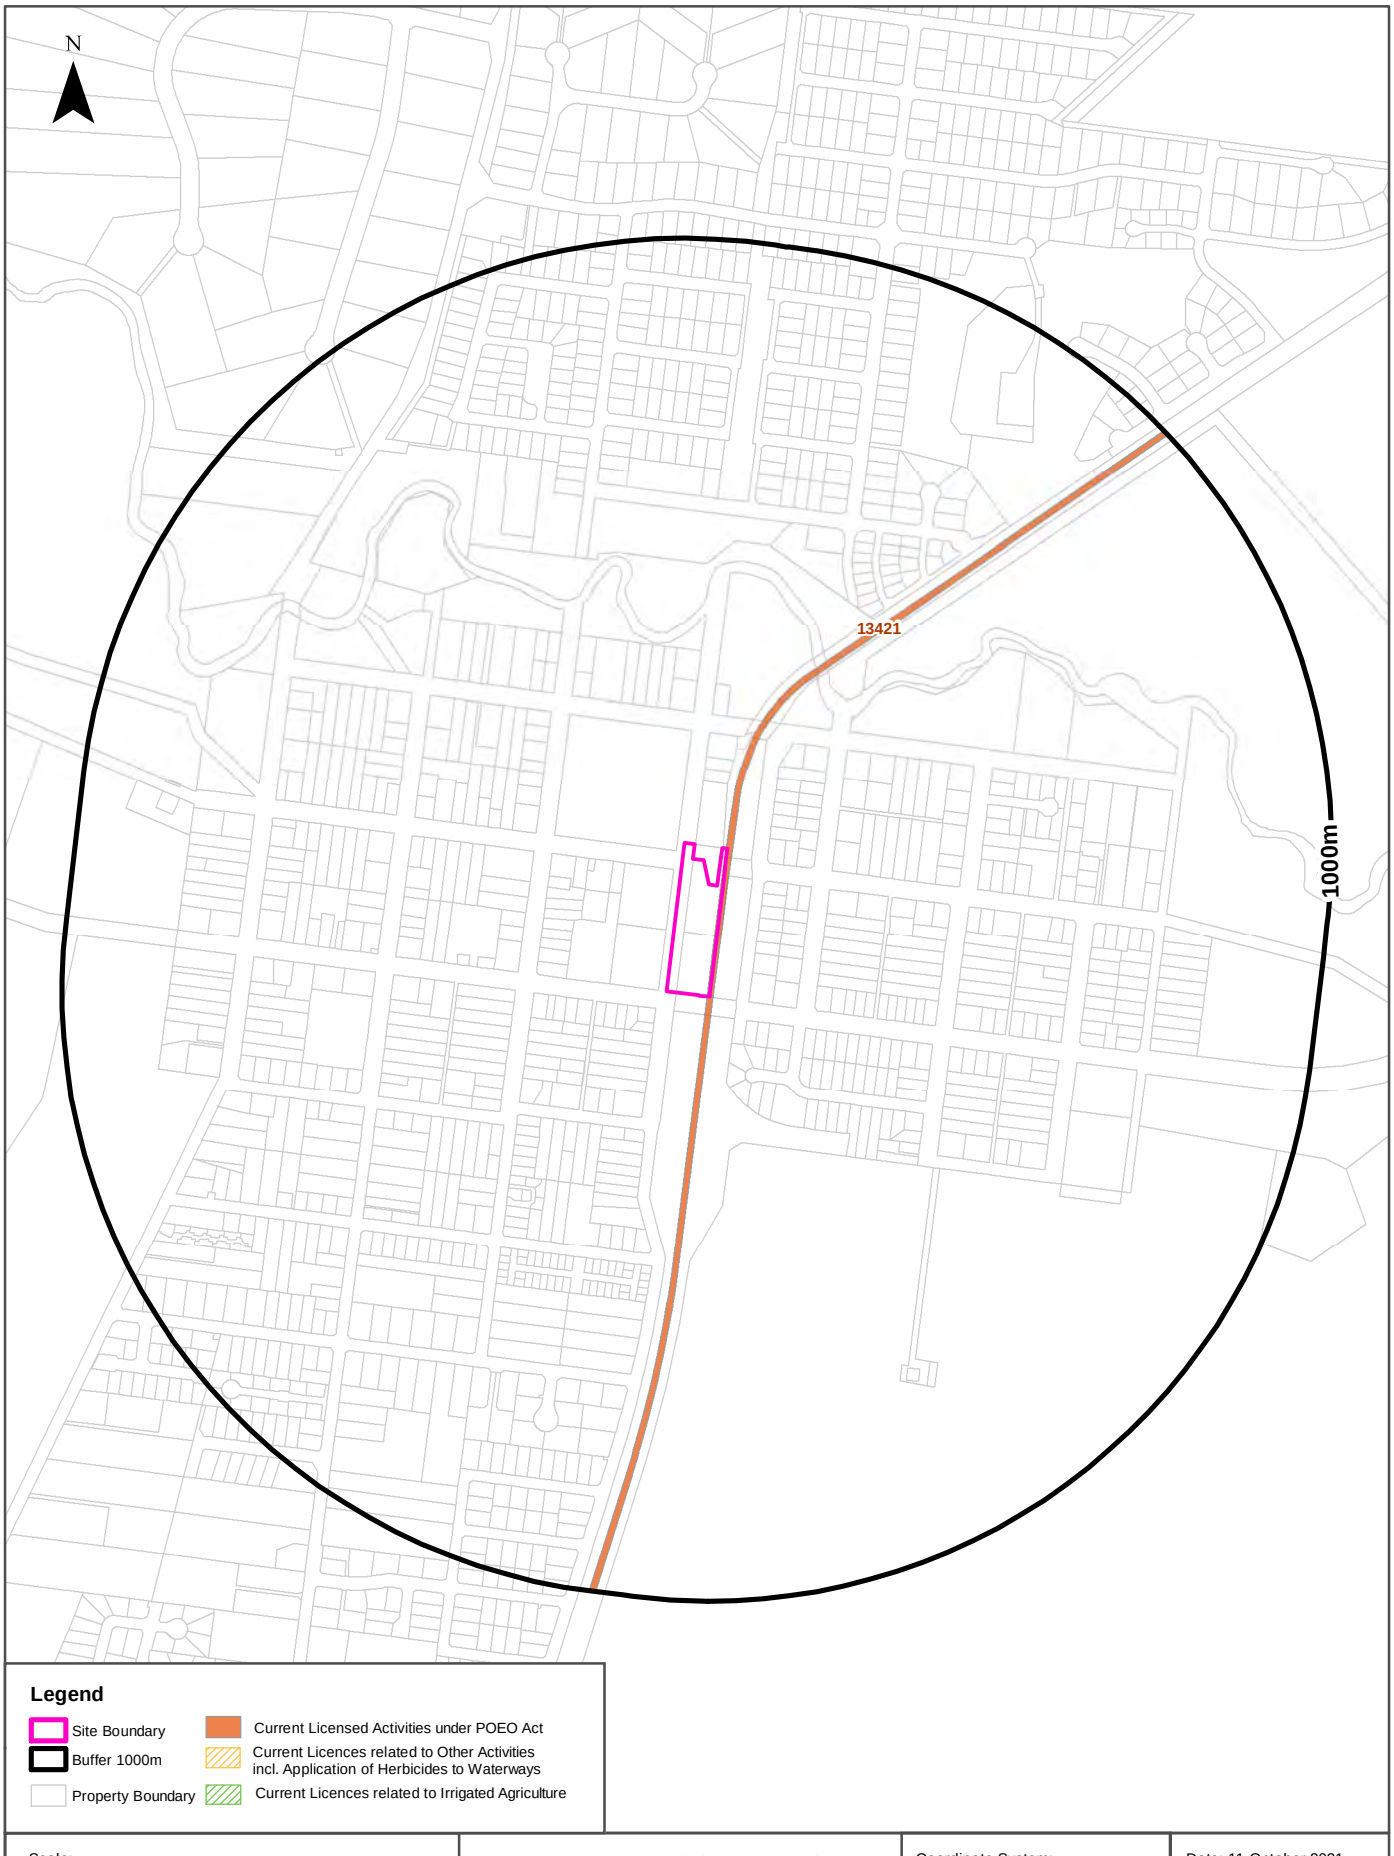
Sites within the dataset buffer:

Site Id	Site Name	Site Address	Dataset	Comments	Location Confidence	Distance	Direction
N/A	No records in buffer						

EPA Other Sites with Contamination Issues: Environment Protection Authority

Current EPA Licensed Activities

Bungendore Railway Station, Bungendore, NSW 2621



EPA Activities

Bungendore Railway Station, Bungendore, NSW 2621

Licensed Activities under the POEO Act 1997

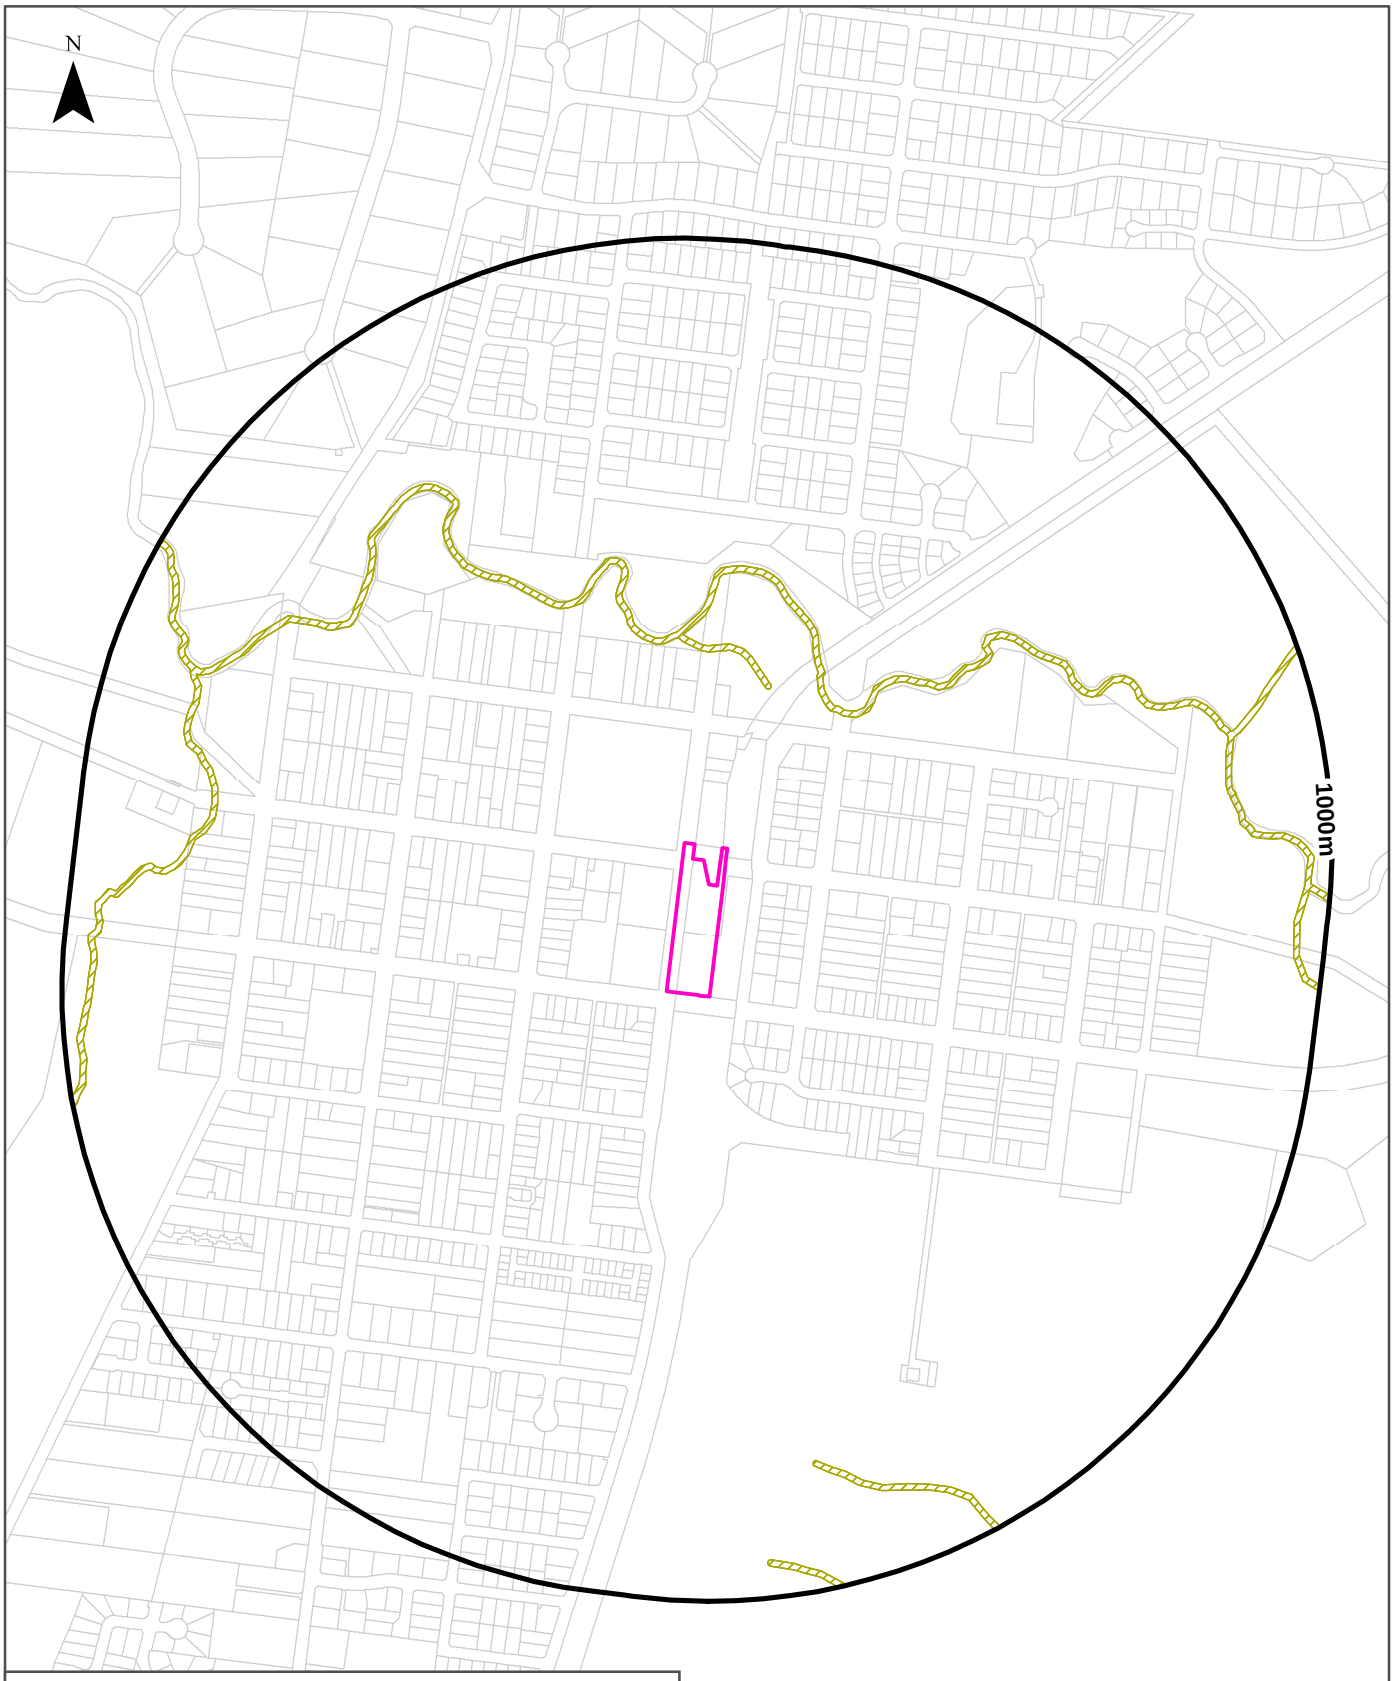
Licensed activities under the Protection of the Environment Operations Act 1997, within the dataset buffer:

EPL	Organisation	Name	Address	Suburb	Activity	Loc Conf	Distance	Direction
13421	JOHN HOLLAND RAIL PTY LTD		JOHN HOLLAND RAIL NETWORK, PARRAMATTA, NSW 2124		Railway systems activities	Network of Features	0m	On-site

POEO Licence Data Source: Environment Protection Authority

Delicensed & Former Licensed EPA Activities

Bungendore Railway Station, Bungendore, NSW 2621



EPA Activities

Bungendore Railway Station, Bungendore, NSW 2621

Delicensed Activities still regulated by the EPA

Delicensed activities still regulated by the EPA, within the dataset buffer:

Licence No	Organisation	Name	Address	Suburb	Activity	Loc Conf	Distance	Direction
N/A	No records in buffer							

Delicensed Activities Data Source: Environment Protection Authority

Former Licensed Activities under the POEO Act 1997, now revoked or surrendered

Former Licensed activities under the Protection of the Environment Operations Act 1997, now revoked or surrendered, within the dataset buffer:

Licence No	Organisation	Location	Status	Issued Date	Activity	Loc Conf	Distance	Direction

Topographic Features

Bungendore Railway Station, Bungendore, NSW 2621

Tanks (Areas)

What are the Tank Areas located within the dataset buffer?
Note. The large majority of tank features provided by LPI are derived from aerial imagery & are therefore primarily above ground tanks.

Map Id	Tank Type	Status	Name	Feature Currency	Distance	Direction
N/A	No records in buffer					

Tanks (Points)

What are the Tank Points located within the dataset buffer?
Note. The large majority of tank features provided by LPI are derived from aerial imagery & are therefore primarily above ground tanks.

Map Id	Tank Type	Status	Name	Feature Currency	Distance	Direction
174976	Water	Operational		23/09/2002	707m	South East
174977	Water	Operational		23/09/2002	714m	South East
174979	Water	Operational		23/09/2002	808m	North East
174980	Water	Operational		23/09/2002	869m	West
176498	Water	Operational		21/10/2010	875m	North East

Major Easements

What Major Easements exist within the dataset buffer?
Note. Easements provided by LPI are not at the detail of local governments. They are limited to major easements such as Right of Carriageway, Electrical Lines (66kVa etc.), Easement to drain water & Significant subterranean pipelines (gas, water etc.).

Map Id	Easement Class	Easement Type	Easement Width	Distance	Direction
164599484	Primary	Right of way	5m	322m	North West
164469748	Primary	Right of way	5m	327m	North West
167900708	Primary	Right of way	15.11m & 18.14m	660m	North West
120116363	Primary	Undefined		713m	West
120120318	Primary	Undefined		776m	North West

Topographic Features

Bungendore Railway Station, Bungendore, NSW 2621

State Forest

What State Forest exist within the dataset buffer?

State Forest Number	State Forest Name	Distance	Direction
N/A	No records in buffer		

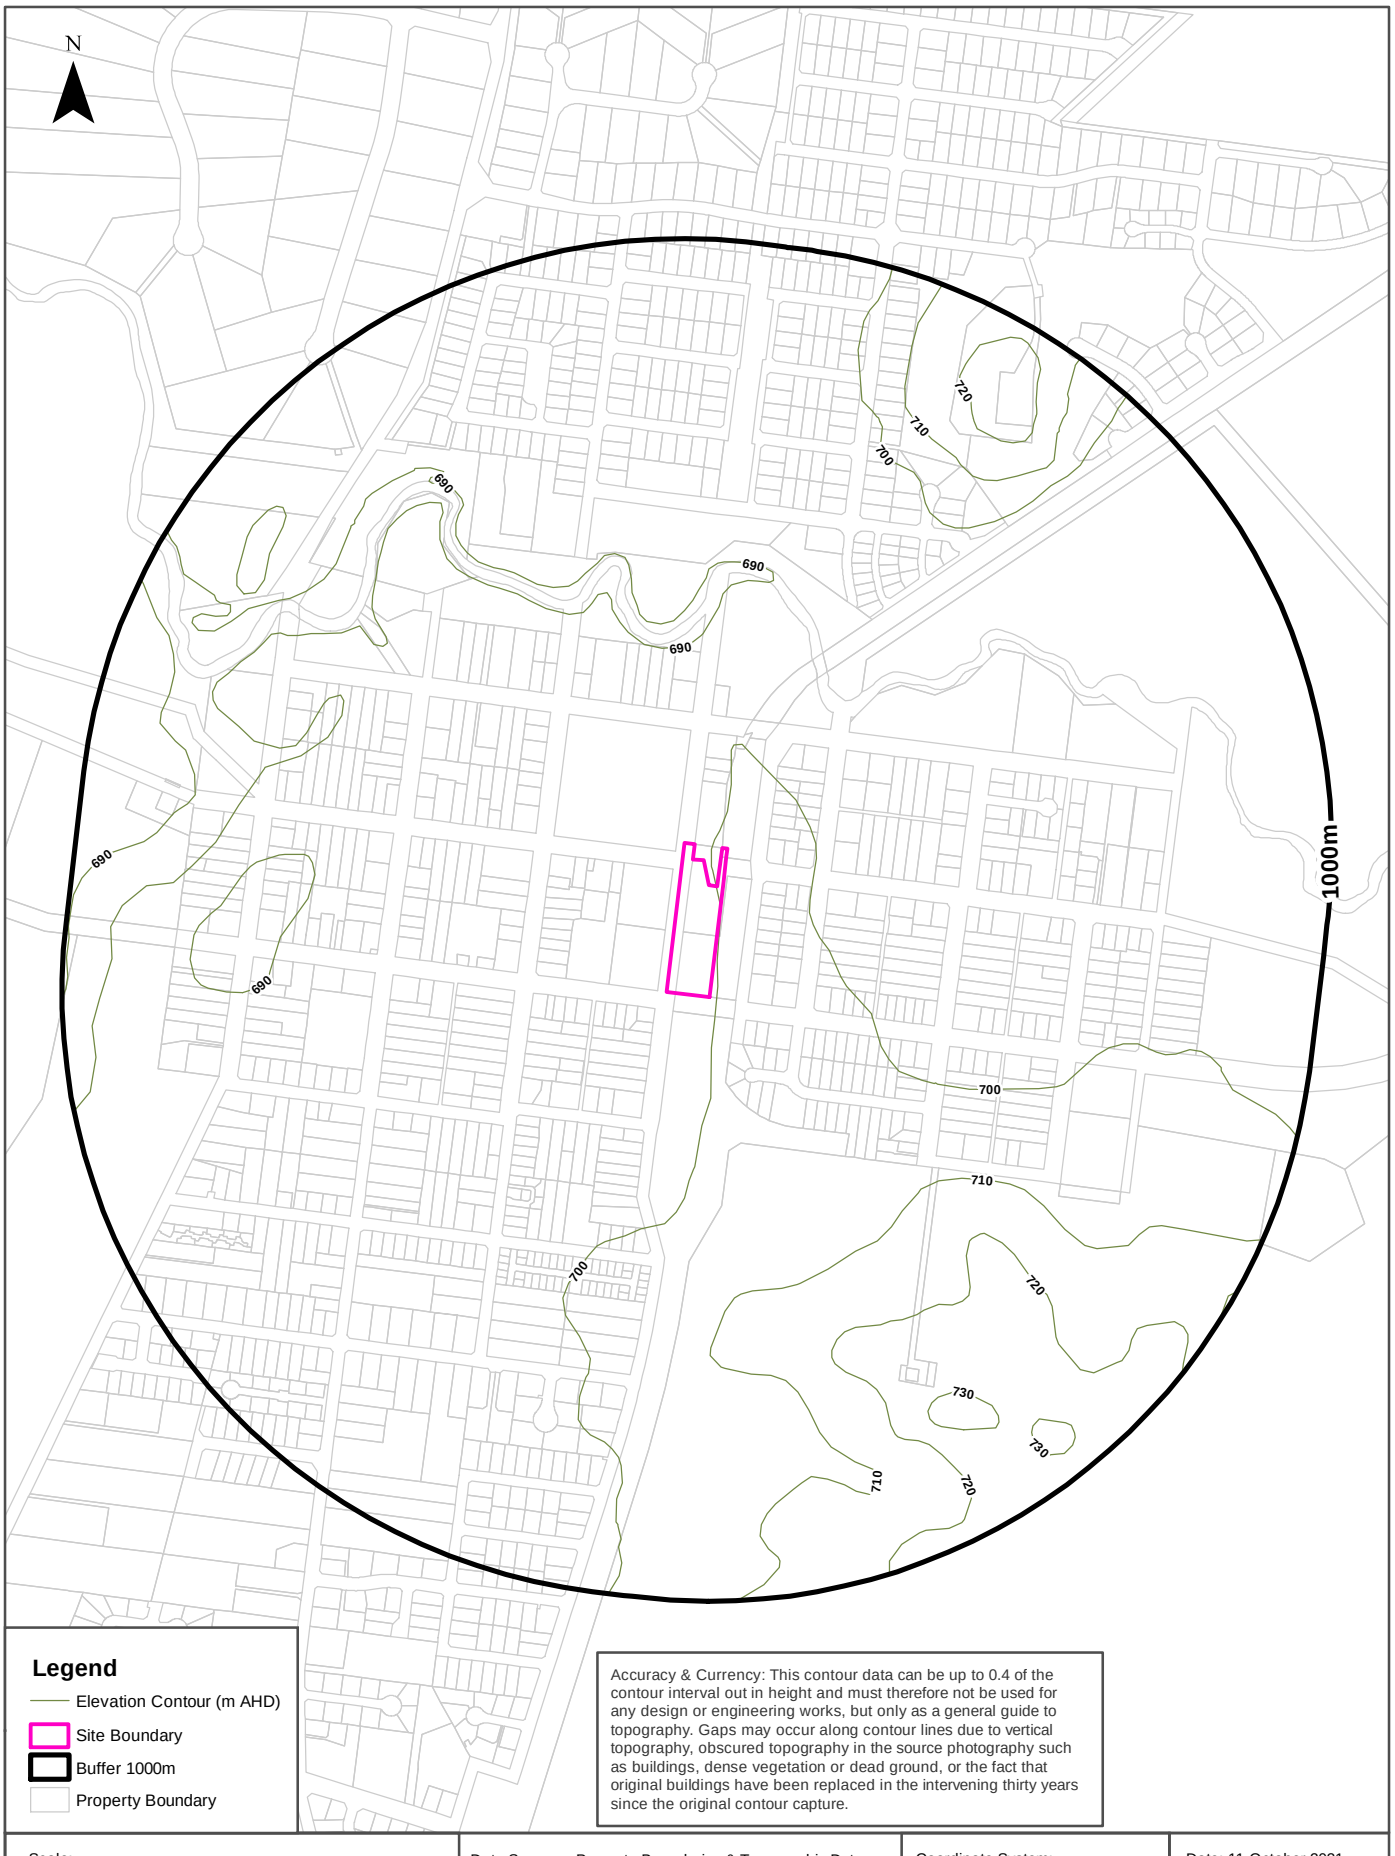
National Parks and Wildlife Service Reserves

What NPWS Reserves exist within the dataset buffer?

Reserve Number	Reserve Type	Reserve Name	Gazetted Date	Distance	Direction
N/A	No records in buffer				

Elevation Contours (m AHD)

Bungendore Railway Station, Bungendore, NSW 2621



Accuracy & Currency: This contour data can be up to 0.4 of the contour interval out in height and must therefore not be used for any design or engineering works, but only as a general guide to topography. Gaps may occur along contour lines due to vertical topography, obscured topography in the source photography such as buildings, dense vegetation or dead ground, or the fact that original buildings have been replaced in the intervening thirty years since the original contour capture.

Scale: 0 100 200 400 Meters	Data Sources: Property Boundaries & Topographic Data: © Department Finance, Services & Innovation 2021	Coordinate System: GDA 1994 MGA Zone 56	Date: 11 October 2021

Hydrogeology & Groundwater

Bungendore Railway Station, Bungendore, NSW 2621

Hydrogeology

Description of aquifers within the dataset buffer:

Description	Distance	Direction
Porous, extensive highly productive aquifers	0m	On-site

Hydrogeology Map of Australia : Commonwealth of Australia (Geoscience Australia)

Temporary Water Restriction (Botany Sands Groundwater Source) Order 2018

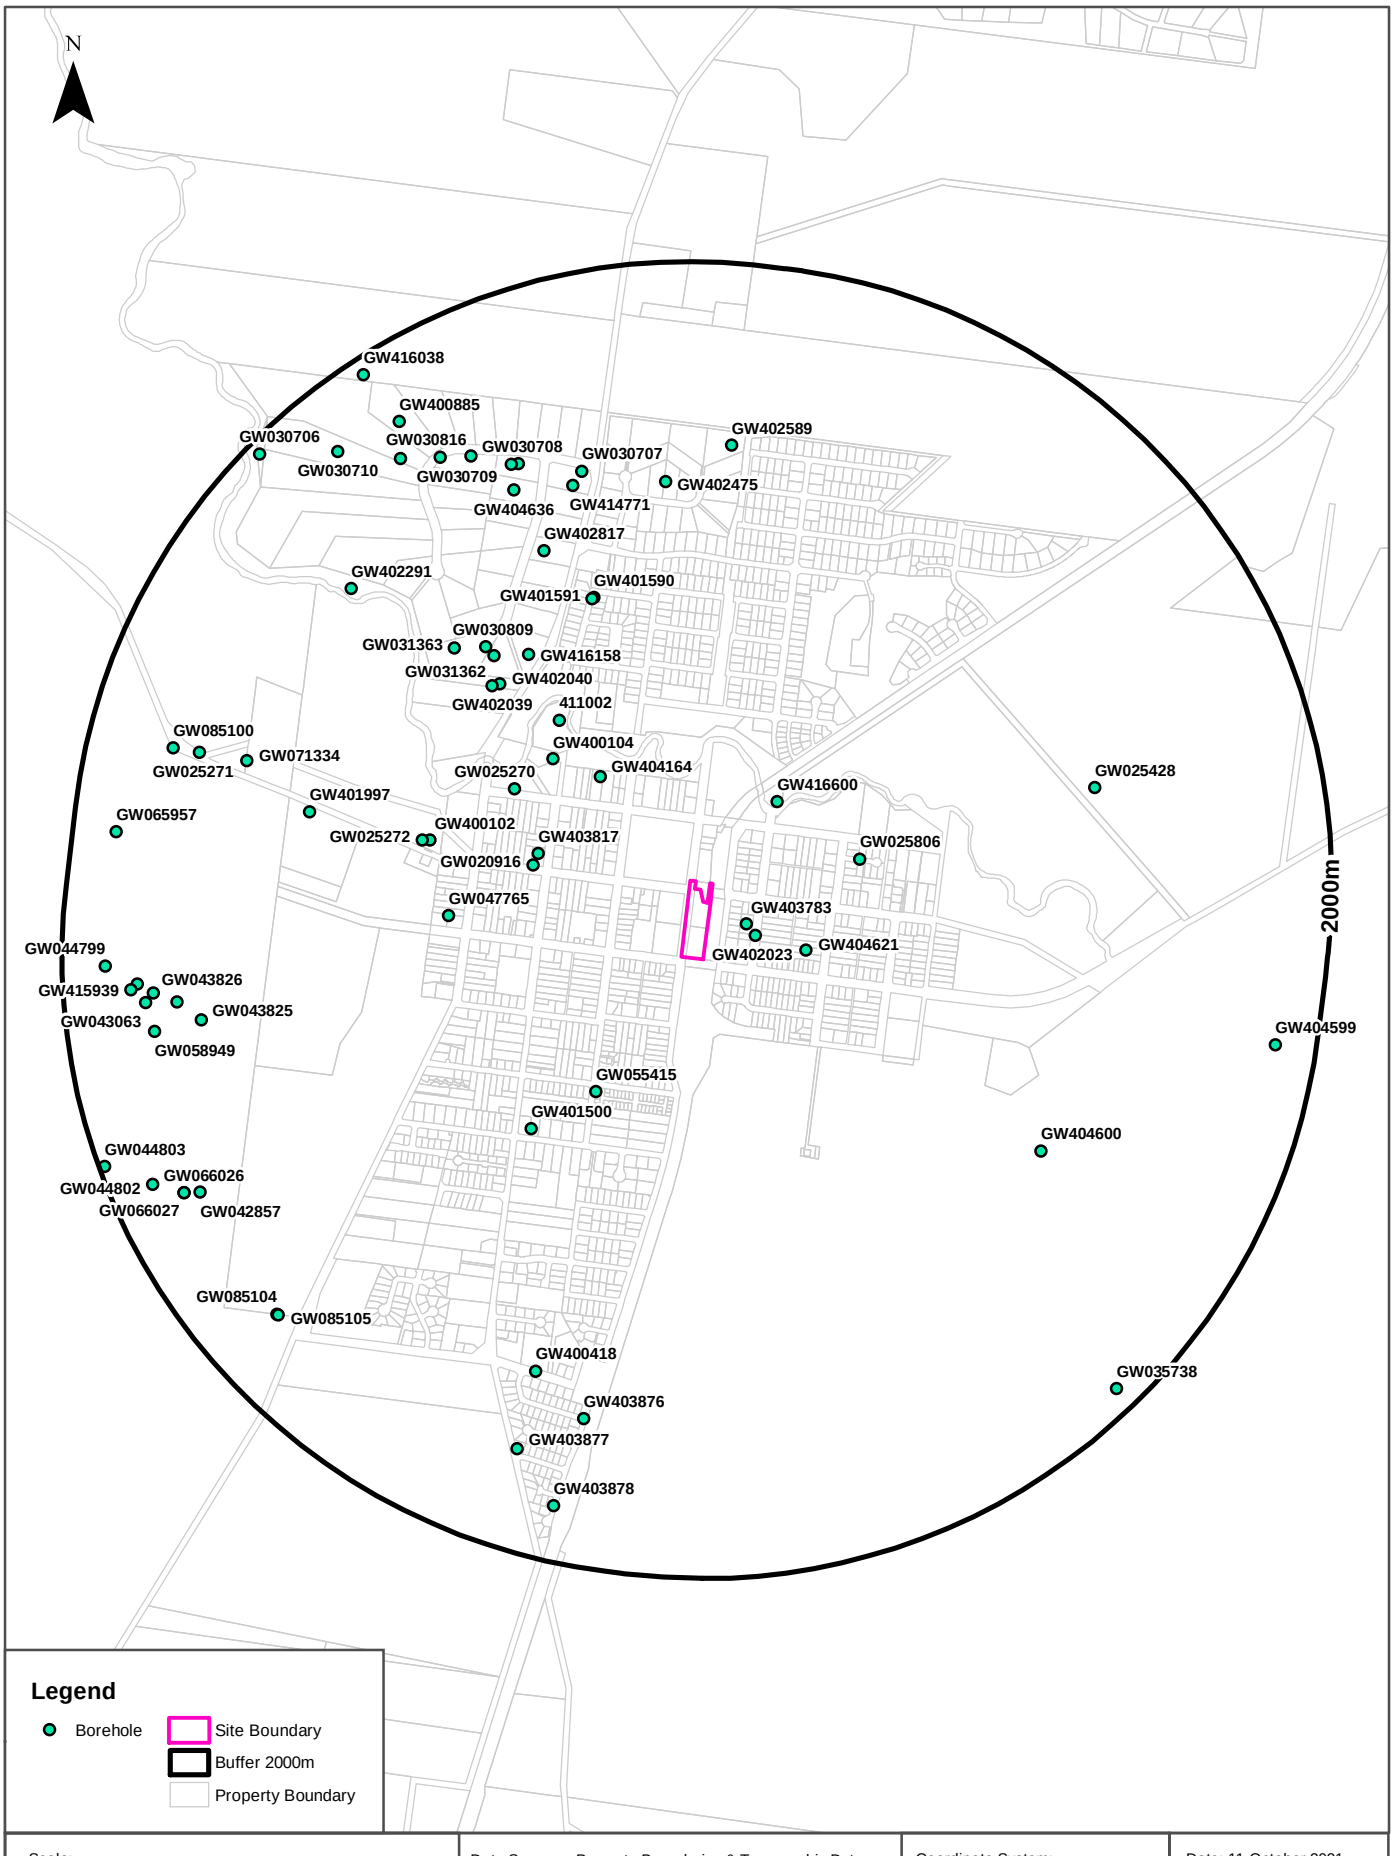
Temporary water restrictions relating to the Botany Sands aquifer within the dataset buffer:

Prohibition Area No.	Prohibition	Distance	Direction
N/A	No records in buffer		

Temporary Water Restriction (Botany Sands Groundwater Source) Order 2018 Data Source : NSW Department of Primary Industries

Groundwater Boreholes

Bungendore Railway Station, Bungendore, NSW 2621



Hydrogeology & Groundwater

Bungendore Railway Station, Bungendore, NSW 2621

Atlas of Australian Soils

Soil mapping units and Australian Soil Classification orders within the dataset buffer:

Map Unit Code	Soil Order	Map Unit Description	Distance	Direction
Va23	Sodosol	Basin plains at moderate elevations (> 2000 ft) with lakes, swamps, lunettes, small stream valleys, and low residual hills and ridges; some buried layered soil materials: basin plains of hard alkaline and neutral yellow mottled soils (Dy3.43 and Dy3.42) with other undescribed soils. Associated are (i) lunettes and/or levee-like ridges of red earths (Gn2.15) and possibly some sand sheets of (Uc) soils; (ii) narrow depressions of (Dd1.43) soils; (iii) ?old terrace remnants of (Dr2.41) soils above which some gravel fills may occur; and (iv) broken by some undulating to low hilly areas of (Dy3.42) soils with (Gn2.25 and Gn2.75) soils.	0m	On-site

Acid Sulfate Soils

Bungendore Railway Station, Bungendore, NSW 2621

Environmental Planning Instrument - Acid Sulfate Soils

What is the on-site Acid Sulfate Soil Plan Class that presents the largest environmental risk?

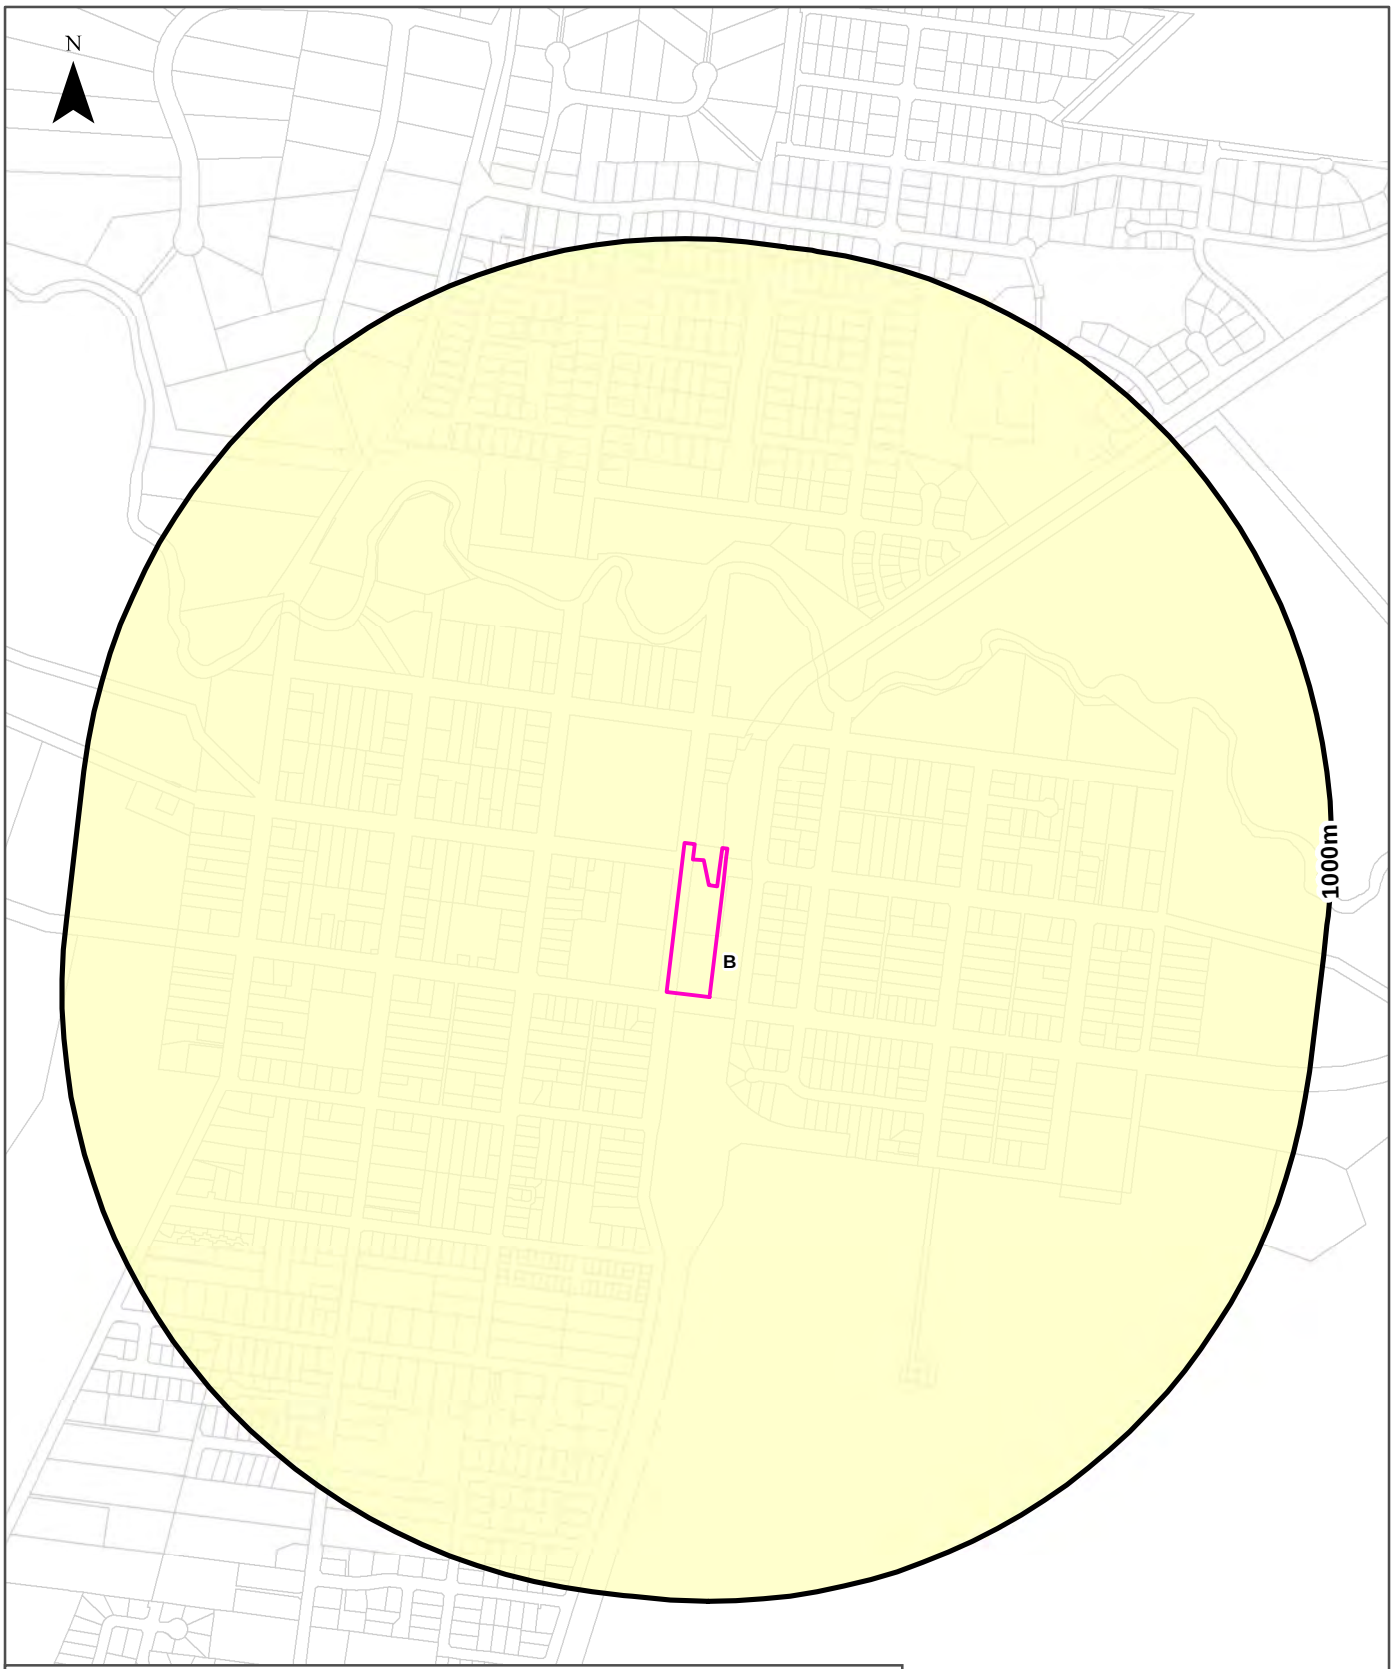
Soil Class	Description	EPI Name
N/A		

If the on-site Soil Class is 5, what other soil classes exist within 500m?

Soil Class	Description	EPI Name	Distance	Direction
N/A				

Atlas of Australian Acid Sulfate Soils

Bungendore Railway Station, Bungendore, NSW 2621



Legend

- Site Boundary
- Buffer 1000m

Kingdom	Class	Scientific	Common	NSW Conservation Status	NSW Sensitivity Class	Federal Conservation Status	Migratory Species Agreements
Plantae	Flora	Eucalyptus leucoxylon subsp. pruinosa	Yellow Gum	Vulnerable	Not Sensitive	Not Listed	
Plantae	Flora	Eucalyptus macarthurii	Paddys River Box, Camden Woollybutt	Endangered	Not Sensitive	Endangered	
Plantae	Flora	Lepidium hyssopifolium	Aromatic Peppercress	Endangered	Not Sensitive	Endangered	
Plantae	Flora	Leucochrysum albicans var. tricolor	Hoary Sunray	Not Listed	Not Sensitive	Endangered	
Plantae	Flora	Senecio macrocarpus		Not Listed	Not Sensitive	Vulnerable	
Plantae	Flora	Swainsona recta	Small Purple-pea	Endangered	Not Sensitive	Endangered	
Plantae	Flora	Wilsonia rotundifolia	Round-leafed Wilsonia	Endangered	Not Sensitive	Not Listed	

Data does not include NSW category 1 sensitive species.

Location Confidences

Where Lotsearch has had to georeference features from supplied addresses, a location confidence has been assigned to the data record. This indicates a confidence to the positional accuracy of the feature. Where applicable, a code is given under the field heading “LC” or “LocConf”. These codes lookup to the following location confidences:

LC Code	Location Confidence
Premise Match	Georeferenced to the site location / premise or part of site
Area Match	Georeferenced to an approximate or general area
Road Match	Georeferenced to a road or rail corridor
Road Intersection	Georeferenced to a road intersection
Buffered Point	A point feature buffered to x metres
Adjacent Match	Land adjacent to a georeferenced feature
Network of Features	Georeferenced to a network of features
Suburb Match	Georeferenced to a suburb boundary
As Supplied	Spatial data supplied by provider

USE OF REPORT - APPLICABLE TERMS

The following terms apply to any person (End User) who is given the Report by the person who purchased the Report from Lotsearch Pty Ltd (ABN: 89 600 168 018) (Lotsearch) or who otherwise has access to the Report (Terms). The contract terms that apply between Lotsearch and the purchaser of the Report are specified in the order form pursuant to which the Report was ordered and the terms set out below are of no effect as between Lotsearch and the purchaser of the Report.

1. End User acknowledges and agrees that:
   (a) the Report is compiled from or using content (**Third Party Content**) which is comprised of:
      (i) content provided to Lotsearch by third party content suppliers with whom Lotsearch has contractual arrangements or content which is freely available or methodologies licensed to Lotsearch by third parties with whom Lotsearch has contractual arrangements (**Third Party Content Suppliers**); and
      (ii) content which is derived from content described in paragraph (i);
   (b) Neither Lotsearch nor Third Party Content Suppliers takes any responsibility for or give any warranty in relation to the accuracy or completeness of any Third Party Content included in the Report including any contaminated land assessment or other assessment included as part of a Report;
   (c) the Third Party Content Suppliers do not constitute an exhaustive set of all repositories or sources of information available in relation to the property which is the subject of the Report (**Property**) and accordingly neither Lotsearch nor Third Party Content Suppliers gives any warranty in relation to the accuracy or completeness of the Third Party Content incorporated into the report including any contaminated land assessment or other assessment included as part of a Report;
   (d) Reports are generated at a point in time (as specified by the date/time stamp appearing on the Report) and accordingly the Report is based on the information available at that point in time and Lotsearch is not obliged to undertake any additional reporting to take into consideration any information that may become available between the point in time specified by the date/time stamp and the date on which the Report was provided by Lotsearch to the purchaser of the Report;
   (e) Reports must be used or reproduced in their entirety and End User must not reproduce or make available to other persons only parts of the Report;
   (f) Lotsearch has not undertaken any physical inspection of the property;
   (g) neither Lotsearch nor Third Party Content Suppliers warrants that all land uses or features whether past or current are identified in the Report;
   (h) the Report does not include any information relating to the actual state or condition of the Property;
   (i) the Report should not be used or taken to indicate or exclude actual fitness or unfitness of Land or Property for any particular purpose
   (j) the Report should not be relied upon for determining saleability or value or making any other decisions in relation to the Property and in particular should not be taken to be a rating or assessment of the desirability or market value of the property or its features; and
   (k) the End User should undertake its own inspections of the Land or Property to satisfy itself that there are no defects or failures
2. The End User may not make the Report or any copies or extracts of the report or any part of it available to any other person. If End User wishes to provide the Report to any other person or make extracts or copies of the Report, it must contact the purchaser of the Report before doing so to ensure the proposed use is consistent with the contract terms between Lotsearch and the purchaser.
3. Neither Lotsearch (nor any of its officers, employees or agents) nor any of its Third Party Content Suppliers will have any liability to End User or any person to whom End User provides the Report and End User must not represent that Lotsearch or any of its Third Party Content Suppliers accepts liability to any such person or make any other representation to any such person on behalf of Lotsearch or any Third Party Content Supplier.
4. The End User hereby to the maximum extent permitted by law:
   (a) acknowledges that the Lotsearch (nor any of its officers, employees or agents), nor any of its Third Party Content Supplier have any liability to it under or in connection with the

Report or these Terms;

(b) waives any right it may have to claim against Third Party Content Supplier in connection with the Report, or the negotiation of, entry into, performance of, or termination of these Terms; and

(c) releases each Third Party Content Supplier from any claim it may have otherwise had in connection with the Report, or the negotiation of, entry into, performance of, or termination of these Terms.

5. The End User acknowledges that any Third Party Supplier shall be entitled to plead the benefits conferred on it under clause 4, despite not being a party to these terms.
6. End User must not remove any copyright notices, trade marks, digital rights management information, other embedded information, disclaimers or limitations from the Report or authorise any person to do so.
7. End User acknowledges and agrees that Lotsearch and Third Party Content Suppliers retain ownership of all copyright, patent, design right (registered or unregistered), trade marks (registered or unregistered), database right or other data right, moral right or know how or any other intellectual property right in any Report or any other item, information or data included in or provided as part of a Report.
8. To the extent permitted by law and subject to paragraph 9, all implied terms, representations and warranties whether statutory or otherwise relating to the subject matter of these Terms other than as expressly set out in these Terms are excluded.
9. Subject to paragraph 6, Lotsearch excludes liability to End User for loss or damage of any kind, however caused, due to Lotsearch's negligence, breach of contract, breach of any law, in equity, under indemnities or otherwise, arising out of all acts, omissions and events whenever occurring.
10. Lotsearch acknowledges that if, under applicable State, Territory or Commonwealth law, End User is a consumer certain rights may be conferred on End User which cannot be excluded, restricted or modified. If so, and if that law applies to Lotsearch, then, Lotsearch's liability is limited to the greater of an amount equal to the cost of resupplying the Report and the maximum extent permitted under applicable laws.
11. Subject to paragraph 9, neither Lotsearch nor the End User is liable to the other for:
    (a) any indirect, incidental, consequential, special or exemplary damages arising out of or in relation to the Report or these Terms; or
    (b) any loss of profit, loss of revenue, loss of interest, loss of data, loss of goodwill or loss of business opportunities, business interruption arising directly or indirectly out of or in relation to the Report or these Terms,

    irrespective of how that liability arises including in contract or tort, liability under indemnity or for any other common law, equitable or statutory cause of action or otherwise.
12. These Terms are subject to New South Wales law.

APPENDIX D DQO'S

D1. DATA QUALITY OBJECTIVES

Data quality objectives (DQOs) were developed to define the type and quality of data required to achieve the project objectives outlined in *Section 1.2*. The DQOs have been prepared in line with the seven-step approach outlined in National Environment Protection (Assessment of Site Contamination) Measure (the ASC NEPM) (NEPC, 1999) (as amended 2013), and with reference to relevant guidelines published by the ACT EPA, specifically the Contaminated Sites Environment Protection Policy (December 2017).

The DQO process is validated, in part, by the quality assurance and quality control (QA/QC) procedures and assessment presented in *Section 6.6* of this report. The seven steps of the DQO process, and how they were applied to this assessment, are presented in the following subsections.

D1.1 STEP 1: STATE THE PROBLEM

The site is currently owned by the Transport for NSW (TfNSW) via the Transport Assets Holding Entity (TAHE) and is managed by Sydney Trains. JHR are currently managing rail operations and maintenance services for the Country Regional Rail Network (CRN) on behalf of TfNSW, which includes the rail corridor adjacent to the Site. ERM understands that TfNSW and JHR would like to understand the likelihood of the presence of contamination at the Site and whether any identified contamination may present a risk of on or offsite receptors.

D1.2 STEP TWO: IDENTIFY THE DECISIONS

Overall the principal decision to be made is whether potential risk to human health or the environment exists as a result of historical site activities. In order to inform this decision, the following questions need to be considered:

- What potential sources of contamination are or were present at the site?
- Is the sampling pattern adequate to collect the required data to achieve the PSI objectives?
- What is the nature and extent of COPCs in near surface soils at the site?
- Is contamination in excess of relevant guideline values present?
- What receptors are potentially at risk of exposure?
- What potential exposure scenarios should be considered?
- Does the contamination likely warrant notification under the Environment Protection Act 1997?
- Is material remediation or management likely to be required?

D1.3 STEP 3: IDENTIFY INPUTS TO DECISION

The primary inputs required to make the above decisions are as follows:

- general observations of the Site;
- review of historical information pertaining to the site;
- the type, number and location of sampling points;

- direct measurement and observation of environmental variables;
- laboratory measurement of soil samples for the identified COPCs;
- field and laboratory quality assurance/quality control data;
- assessment of concentrations of COPCs against relevant published human health and ecological risk screening criteria; and
- Likelihood of identified receptors being exposed to concentrations of COPCs above the relevant adopted criteria.

D1.4 STEP 4: DEFINE THE STUDY BOUNDARIES

D1.4.1 Spatial Boundaries

The spatial boundary of the investigation is limited to the site and specifically the soil investigation locations presented on Figure 2. The investigation included the surface soils (to ~0.1m) within the investigation area.

D1.4.2 Temporal Boundaries

Temporally, the investigation was intended to provide a preliminary assessment the nature and extent of potential soil lead contamination across the investigation area. The preliminary investigation occurred on the 7th & 8th of October 2021

D1.5 STEP FIVE: DEVELOP A DECISION RULE

The DQOs have been developed to facilitate the collection of adequate soil data to address the decisions outlined in Step 2 of the DQO process. The potential significance of field observations / measurement have been considered throughout this investigation, however the primary decision rule utilised for this assessment was comparison of analytical data with relevant published human health and ecological risk screening criteria, and consideration of background conditions.

Individual soil data were compared to the relevant screening criteria. Exceedance of the screening criteria does not necessarily indicate the requirement for remediation or a risk to human health and / or the environment through the qualitative assessment of the potential linkage between the source and the receptor via a pathway and described through the initial conceptual site model (CSM). If individual concentrations exceeded the screening criteria, consideration of the extent of the impact, the potential for receptors to be exposed and regulatory compliance was considered.

D1.5.1 Screening Criteria

The Tier 1 screening criteria for soil data has been selected based on a review of the following reference documents:

- the ASC NEPM: Schedule B1: Guideline on the Investigation Levels for Soil and Groundwater.

Screening criteria were selected with consideration of the following items:

- the Site has been used as an operational railway station (considered to be commercial/industrial);
- ongoing commercial/ industrial use of the Site;

- a school is located across the road from the Site;
- a residence is located on the northern boundary of the Site;
- recreational and communal walking tracks and areas are present onsite;
- primary lithology – range from sands to clays; and
- depth of media under assessment (i.e. <0.1m bgl).

Relevant screening criteria selected for comparison against the soil results are discussed in *Section 5.9* of this report.

D1.5.2 Appropriateness of Laboratory Limit of Reporting

Laboratory analytical techniques have limits to their precision, and the Limit of Reporting (LOR) describes the lowest concentration that can be reported with confidence. Where a given assessment criteria is lower than the LOR concentration, a meaningful comparison generally cannot be made.

This investigation has employed standard LORs. Comparison of the LOR with the assessment criteria will be undertaken to confirm that the assessment criteria are less than the laboratory LOR and any exceptions to this shall be appropriately noted and justified.

D1.6 STEP 6: SPECIFY LIMITS ON DECISION ERRORS

The acceptable limits on decision errors applied during the review of the results will be based on the Data Quality Indicators (DQIs) of Precision, Accuracy, Representativeness, Comparability and Completeness (PARCC) in accordance with the ASC NEPM, Schedule B(3) - Guidelines on Laboratory Analysis.

The potential for significant decision errors will be reduced by:

- completing a robust QA/QC assessment of the data, requiring that 95% of data satisfy the DQIs and therefore placing a limit on the decision error of 5% (see *Section* 5.11 and *Appendix E*);
- assessing whether appropriate sampling and analytical density has been achieved for the purposes of meeting the project objectives; and
- ensuring that the assessment criteria selected are appropriate for the current and future commercial/industrial and open space land uses, as well as potential ecological and residential receptors.

D1.7 STEP 7: DEVELOP (OPTIMISE) THE PLAN FOR COMPLETING THE WORKS

The investigation scope was tailored to match DQOs with project objectives, to combine targeted investigation based on existing knowledge and discussions with JHR. During the site inspection the scope was continuously reviewed to accommodate new information such as potential sources of site contamination (e.g. areas of staining or topography).

APPENDIX E QUALITY ASSURANCE AND QUALITY CONTROL

E1. QUALITY ASSURANCE AND QUALITY CONTROL ASSESSMENT

The objective of this data assessment is to evaluate the quality of data gathered during the investigation detailed in the main body of this report. This process has been undertaken to assess whether the sample data is of a suitable standard to be utilised in this report. The data assessment consists of comparing field and laboratory QA/QC results to documented guidelines outlined in *Section 1.3*. The data assessment has been prepared in accordance with the ASC NEPM – Schedule B2: Guideline on Site Characterisation. Particular reference is made to the PARCC parameters (precision, accuracy, representativeness, completeness and comparability) in evaluating the data quality.

Table E1 presents the degree of QA/QC pertinent to the field investigations.

Table E1 Field QA/QC Assessment

QA/QC Criterion	Comments
QA/QC program includes duplicate samples.	In order to demonstrate the suitability of the 15 primary soil samples analysed, field quality control samples included 1 intra-laboratory duplicate and 1 inter-laboratory duplicates. The Relative Percentage Difference (RPDs) of the soil sample duplicate pair had a number of RDPs outside of the acceptable range for metals. RPDs as presented in *Table E4*. It is considered that the outlying RPD results are likely due to the heterogeneous nature of the materials sampled a potential heterogeneous distribution of contaminants throughout the soil profile. As a conservative measure both the parent and duplicate samples have been presented against the adopted Tier 1 screening criteria.
Appropriate decontamination procedures were adopted.	Decontamination procedures were implemented between collections of samples in accordance with ERM SOPs. Samples were collected from a hand trowel which was decontaminated between each sample location. All non-dedicated sampling equipment was decontaminated between sampling locations where designated disposable materials are not used. Decontamination procedures were as follows: ■ all loose soil removed with a stiff brush; ■ washed in potable (tap) water and brush scrubbing using tap water and a non-phosphate detergent (Decon 90®); ■ rinsed with potable water; and ■ air dried. Field QAQC measures (including the use of new disposable nitrile gloves between samples, and decontamination of sampling tools) were considered appropriate to minimise cross-contamination between samples. The rinsate blank sample did not provide any readings above the EQL (*Table E5*), indicating decontamination measures appropriately mitigated cross contamination.
All relevant media assessed	Soil was collected from near surface materials and submitted for laboratory analysis. This was considered appropriate for the preliminary nature of the investigation.

QA/QC Criterion	Comments
Appropriateness of sampling strategy	The spatial coverage achieved was considered to be suitable in achieving the project objectives, in the context of the preliminary nature of the assessment. In addition to comprehensive spatial coverage, sample locations were distributed across the area of investigation to target historical potential sources of impact to ensure coverage of the area's most likely to be contaminated.
Sample collection, handling and transportation procedures.	Samples were collected, handled and transported in line with ERM SOP's. Soil samples were placed in laboratory supplied sample bags, stored in a cool box, and forwarded to the NATA accredited laboratory under COC conditions. The methods used to collect the samples, the types of sample containers, preservation techniques and custody protocols were documented appropriately.
Field QA/QC plan	The sampling team was suitably qualified and experienced to conduct the required works. Field reports describing the media sampled, any indication of potential contamination, duplicate samples and sampling locations were completed.

Table E2 presents the degree of QA/QC pertinent to the laboratory program.

Table E2 Laboratory QA/QC Assessment

QA/QC Criterion	Comments
Appropriate methodologies used for sample analyses	The laboratory used for the investigation works were NATA accredited All laboratory reports were NATA stamped and signed by a NATA signatory. All methodologies were considered appropriate for the identified contaminants of concern in the matrix.
Appropriate Limit of Reporting (LOR)	The laboratory LOR for each analyte is presented in the laboratory reports and summary tables. Soil samples results were reported with LORs below the relevant site assessment criteria.
Laboratory QA/QC plan	Copies of signed chain of custody forms were returned by the laboratory. The primary laboratory and secondary laboratory were both NATA accredited. All laboratory certificates are provided in *Appendix G.* It is noted that the analytical methods completed were NATA approved as documented on the laboratory reports. Samples were received and analysed within specified laboratory holding times. The types of QA/QC samples analysed by the laboratory for the documented samples were considered sufficient to assess the precision and accuracy of the laboratory methods used. The statistical data presented in the laboratory QA/QC report was considered adequate in demonstrating the precision and accuracy of the methods used to analyse field samples. Any QA/QC outliers are reported in laboratory documentation included in Appendix G and were considered appropriate by the laboratory.

Table E3 below summarises the QA/QC results in relation to the data quality indicators of precision, accuracy, representativeness, comparability and completeness for the investigation sampling program.

Table E3 Overall Sampling and Analysis Methodology Assessment

Field Considerations	Laboratory Considerations
Precision Requirements	
The soil sampling was conducted following ERM SOPs and any variations from these procedures were documented.	Analysis of the following were reported: ■ Laboratory duplicates; and ■ Field intra and inter-laboratory duplicates; and ■ Rinsate blanks.
Precision Comments	
No significant variations from ERM SOPs were noted. As reported in Table E4 Field inter and intra-laboratory duplicates were generally within the acceptance limits, with few exceptions.	
Accuracy Requirements	
The soil sampling was conducted following ERM SOPs and any variations from these procedures were documented.	Analysis of the following were reported where applicable: ■ Laboratory duplicates; ■ Field intra and inter-laboratory duplicates; ■ method blanks; ■ Laboratory control samples.
Accuracy Comments	
No significant variations from ERM SOPs were noted. Laboratory QA/QC samples were generally reported within the acceptance limits specified in the laboratory reports with the exception of those noted above.	
Representativeness Requirements	
Appropriate media were identified and sampled according to ERM SOPs and laboratory standards.	All primary samples were analysed according to the proposed Sampling and Analysis Plan
Representativeness Comments	
The number and type of samples collected as part of investigation works was considered to be representative of the areas of concern**.** The number of sample locations was in accordance with the Sampling and Analysis. Given the investigation density achieved over the site ERM considers that sufficient data is available to establish a suitable assessment of near surface soil conditions at the site.	
Comparability Requirements	
The same SOPs were used during each sampling event. All sampling was conducted by an appropriately qualified and experienced sampler. Impacts of climatic conditions on sample integrity were minimised by storing samples in a chilled cooler. The types of samples collected were consistent.	Analytical methods suitable for the target media were used. The laboratory LORs used to report analyte concentrations were generally less than the adopted investigation criteria for significant contaminants of concern. The same units were used to report analyte concentrations where applicable. Results of laboratory analysis comparable with field screening results where applicable.

Field Considerations	Laboratory Considerations
Comparability Comments	
No significant outliers from the requirements were noted.	
Completeness Requirements	
All relevant locations were sampled, with the exception of locations which were abandoned due to insufficient space for sampling. The sampling program was conducted following ERM SOPs and any variations from these procedures were documented as appropriate. All sampling was conducted by an appropriately qualified and experienced sampler. Documentation of field works was provided.	All critical samples were analysed according to the proposed Sampling and Analysis Plan in ERM proposal C0612302 Appropriate analysis methods and laboratory LORs were used. Sample documentation was provided. Sample holding times were complied with.
Completeness Comments	
The specified requirements for completeness of the dataset were met. The quality of the dataset and overall outcomes of the investigation remain unaffected by the noted RPD and laboratory QA/QC outliers and is considered suitable for the purposes of this investigation.

Sample Information

✓	A detailed list of analytes logged into our LIMS, is included in the attached summary table.
✓	All samples have been received as described on the above COC.
✓	COC has been completed correctly.
✓	Attempt to chill was evident.
✓	Appropriately preserved sample containers have been used.
✓	All samples were received in good condition.
✓	Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.
✓	Appropriate sample containers have been used.
✓	Sample containers for volatile analysis received with zero headspace.
X	Split sample sent to requested external lab.
X	Some samples have been subcontracted.
N/A	Custody Seals intact (if used).

Notes

Contact

If you have any questions with respect to these samples, please contact your Analytical Services Manager:

John Nguyen on phone : or by email: JohnNguyen@eurofins.com

Results will be delivered electronically via email to Matthew Crow - matthew.crow@erm.com.

Note: A copy of these results will also be delivered to the general ERM Sydney email address.

Copper	5	mg/kg	78
Lead	5	mg/kg	770
Manganese	5	mg/kg	240
Mercury	0.1	mg/kg	0.2
Nickel	5	mg/kg	12
Vanadium	10	mg/kg	81
Zinc	5	mg/kg	650

Sample History

Where samples are submitted/analysed over several days, the last date of extraction is reported.

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
Chromium (hexavalent)	Sydney	Oct 18, 2021	28 Days
- Method: In-house method E057.2			
Chromium (trivalent)	Sydney	Oct 14, 2021	28 Days
- Method: E043 /E057 Total Speciated Chromium			
Heavy Metals	Sydney	Oct 18, 2021	28 Days
- Method: LTM-MET-3040 Metals in Waters, Soils & Sediments by ICP-MS			
% Moisture	Sydney	Oct 14, 2021	14 Days
- Method: LTM-GEN-7080 Moisture

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples follows guidelines delineated in the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended May 2013 and are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil/sediment/solid results are reported on a dry basis, unless otherwise stated.
3. All biota/food results are reported on a wet weight basis on the edible portion, unless otherwise stated.
4. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
5. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds.
6. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
7. Samples were analysed on an 'as received' basis.
8. Information identified on this report with blue colour, indicates data provided by customer, that may have an impact on the results.
9. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether the holding time is 7 days however for all other VOCs such as BTEX or C6-10 TRH then the holding time is 14 days.

Units

mg/kg: milligrams per kilogram
mg/L: milligrams per litre
ug/L: micrograms per litre
ppm: Parts per million
ppb: Parts per billion
%: Percentage
org/100mL: Organisms per 100 millilitres
NTU: Nephelometric Turbidity Units
MPN/100mL: Most Probable Number of organisms per 100 millilitres

Terms

Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery.
CRM	Certified Reference Material - reported as percent recovery.
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands and in the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
QSM	US Department of Defense Quality Systems Manual Version
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within.
TEQ	Toxic Equivalency Quotient
WA DWER	Sum of PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

QC - Acceptance Criteria

The acceptance criteria should be used as a guide only and may be different when site specific Sampling Analysis and Quality Plan (SAQP) have been implemented

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

NOTE: pH duplicates are reported as a range not as RPD

Surrogate Recoveries: Recoveries must lie between 20-130% Phenols & 50-150% PFASs..

PFAS field samples that contain surrogate recoveries in excess of the QC limit designated in QSM where no positive PFAS results have been reported have been reviewed and no data was affected.

.

QC Data General Comments

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling. Therefore, laboratory analysis is unlikely to be completed within holding time.Analysis will begin as soon as possible after sample receipt.
4. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of recovery the term "INT" appears against that analyte.
5. For Matrix Spikes and LCS results a dash "-" in the report means that the specific analyte was not added to the QC sample.
6. Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

Quality Control Results

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Ivan Taylor	Analyst	Sydney Inorganics, Smithfield, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

QUALITY CONTROL REPORT

Work Order	: **ES2136205**	Page	: 1 of 7
Client	: **ENVIRONMENTAL RESOURCES MANAGEMENT (ERM)**	Laboratory	: Environmental Division Sydney
Contact	: MR MATTHEW CROW	Contact	: Monica Wright
Address	: LEVEL 1 45 WATT STREET NEWCASTLE NSW 2300	Address	: 277-289 Woodpark Road Smithfield NSW Australia 2164
Telephone	: +61 02 4964 2150	Telephone	: +61-2-8784 8555
Project	: 0608750/03-BUNGENDORE LEAD INVESTIGATION	Date Samples Received	: 08-Oct-2021
Order number	: ----	Date Analysis Commenced	: 12-Oct-2021
C-O-C number	: ----	Issue Date	: 15-Oct-2021
Sampler	: MAX GALBRAITH		
Site	: ----		
Quote number	: EN/114/20		
No. of samples received	: 17		
No. of samples analysed	: 17		

ilac-MRA NATA
Accreditation No. 825
Accredited for compliance with ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Ivan Taylor	Analyst	Sydney Inorganics, Smithfield, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **SOIL**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

ALS Environmental

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **ES2136205**	Page	: 1 of 5
Client	: **ENVIRONMENTAL RESOURCES MANAGEMENT (ERM)**	Laboratory	: Environmental Division Sydney
Contact	: MR MATTHEW CROW	Telephone	: +61-2-8784 8555
Project	: 0608750/03-BUNGENDORE LEAD INVESTIGATION	Date Samples Received	: 08-Oct-2021
Site	: ----	Issue Date	: 15-Oct-2021
Sampler	: MAX GALBRAITH	No. of samples received	: 17
Order number	: ----	No. of samples analysed	: 17

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **NO Quality Control Sample Frequency Outliers exist.**

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **SOIL** Evaluation: × = Holding time breach ; ✓ = Within holding time.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Moisture Content	EA055	SOIL	In house: A gravimetric procedure based on weight loss over a 12 hour drying period at 105-110 degrees C. This method is compliant with NEPM Schedule B(3).
Total Metals by ICP-AES	EG005T	SOIL	In house: Referenced to APHA 3120; USEPA SW 846 - 6010. Metals are determined following an appropriate acid digestion of the soil. The ICPAES technique ionises samples in a plasma, emitting a characteristic spectrum based on metals present. Intensities at selected wavelengths are compared against those of matrix matched standards. This method is compliant with NEPM Schedule B(3)
Total Mercury by FIMS	EG035T	SOIL	In house: Referenced to AS 3550, APHA 3112 Hg - B (Flow-injection (SnCl2) (Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. Mercury in solids are determined following an appropriate acid digestion. Ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM Schedule B(3)
Total Metals by ICP-MS - Suite A	EG020A-T	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
Total Mercury by FIMS	EG035T	WATER	In house: Referenced to AS 3550, APHA 3112 Hg - B (Flow-injection (SnCl2)(Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. A bromate/bromide reagent is used to oxidise any organic mercury compounds in the unfiltered sample. The ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM Schedule B(3).

Preparation Methods	Method	Matrix	Method Descriptions
Hot Block Digest for metals in soils sediments and sludges	EN69	SOIL	In house: Referenced to USEPA 200.2. Hot Block Acid Digestion 1.0g of sample is heated with Nitric and Hydrochloric acids, then cooled. Peroxide is added and samples heated and cooled again before being filtered and bulked to volume for analysis. Digest is appropriate for determination of selected metals in sludge, sediments, and soils. This method is compliant with NEPM Schedule B(3).
Digestion for Total Recoverable Metals	EN25	WATER	In house: Referenced to USEPA SW846-3005. Method 3005 is a Nitric/Hydrochloric acid digestion procedure used to prepare surface and ground water samples for analysis by ICPAES or ICPMS. This method is compliant with NEPM Schedule B(3)

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Sample T01 forwarded to EUROFINS.**
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Analytical work for this work order will be conducted at ALS Sydney.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

EXECUTIVE SUMMARY

Ramboll Australia Pty Ltd (Ramboll) was engaged by John Holland Rail Pty Limited (JHR) on behalf of Transport for NSW (TfNSW) to complete an environmental site assessment at the operational Bungendore Train Station and surrounding rail corridor which forms part of the Country Regional Network (CRN) located at Bungendore, New South Wales (NSW) (the site).

The objectives were:

- To assess the potential presence of contamination on site relating to historic transport of ore through the site and
- To determine the need for further assessment in accordance with the Consultants Reporting on Contaminated Land – Contaminated Land Guidelines (NSW EPA 2020)

The scope of work comprised:

- Systematic site inspection
- A total of 49 in field measurement of metals concentrations using field portable x-ray fluorescence (FPXRF). This included 44 surface measurements and five measurements collected to depths of up to 0.1 meter below ground level from three locations where elevated lead concentrations were observed at surface
- Collection of quality control samples for laboratory analysis
- Comparison of results against tier 1 assessment criteria
- Preparation of this report.

A site inspection was completed by Ramboll environmental scientists experienced in assessment of contaminated sites on 13 February 2021. The following items were noted:

- Site topography was relatively flat with a hill to the north of the site where the rail corridor cuts into the hillside.
- The site comprised the Bungendore Station and rail corridor, unsealed car park and roads and adjacent grassland.
- Evidence of some potential ore and mine waste was present in the southern portion of the site in an area which may have historically joined the existing unsealed road for access off of Malbon Street.
- A drainage swale ran along the western site boundary however no water was observed in the swale during the inspection.

Several exceedances of the health-based criteria for lead were observed in the southern portion of the site near a suspected former access road and in the north along the operational railway line. All exceedances to the health-based criteria were reported at less than 0.1 m depth and it's considered the impacts may be limited to shallow soils.

Key recommendations are:

- Land south of the southern driveway entrance to Bungendore Station be isolated from public access
- A Preliminary Site Investigation should be completed in accordance with the National Environment Protection Measure (NEPC 2013) and the Consultants Reporting on Contaminated Land – Contaminated Land Guidelines (NSW EPA 2020) to consolidate background information relevant to assessment of the nature and extent of contamination at the site

- A Detailed Site Investigation should then be completed to characterise the degree and extent of site contamination, associated risks to human health and the environment and drivers for remediation
- Further assessments should inform the potential Duty to Report contamination under the Contaminated Land Management Act.

1. INTRODUCTION

1.1 Preamble

Ramboll Australia Pty Ltd (Ramboll) was engaged by John Holland Rail Pty Limited (JHR) on behalf of Transport for NSW (TfNSW) to complete an environmental site assessment at the operational Bungendore Train Station and surrounding rail corridor which forms part of the Country Regional Network (CRN) located at Bungendore, New South Wales (NSW) (the site).

This report provides the findings of an Environmental Site Assessment (ESA) undertaken at Bungendore Train Station to assess potential sources of heavy metal contamination at the site and potential risks to human and ecological receptors. The ESA was completed as a preliminary investigation of the potential for contamination at the site and the need for further investigations following guidance relevant to contaminated land.

1.2 Background

Review of the NSW Department of Resources and Geoscience website[1] provides the following background:

'The Lake George Mine is situated at Captains Flat, approximately 50km south east of Canberra. The mine operated from 1892 until 1962, producing lead, zinc, copper, pyrite, silver and gold.'

The Lake George Mine now forms part of the NSW Government Legacy Mines Program (former Derelict Mines Program).

During mining operations an ore loadout complex was used to load ore from the mine to train for transport off site. Investigations of contamination at Captains Flat in 2020[2] and 2021[3] revealed that the historic loadout of ore from the Captains Flat Rail Line has resulted in heavy metal contamination along the Captains Flat to Bungendore line extending north of the Captains Flat Train Station. On this basis it was identified that the Bungendore Train Station may be impacted from this historic ore transport activity.

1.3 Objectives

The objectives were:

- To assess the potential presence of contamination on site relating to historic transport of ore through the site and
- To determine the need for further assessment

1.4 Scope of Work

At the direction of JHR the scope was limited to assessment of metals concentrations in surface soils and does not include other potential contaminants of concern or a Preliminary Site Investigation (PSI) as described in the National Environment Protection Measure (NEPC 2013).

The scope of work comprised:

- Systematic site inspection and walk over
- In field measurement of metals concentrations using field portable x-ray fluorescence (FPXRF) with excavation to 0.1 mgl at locations where elevated lead concentrations were observed

[1] https://www.resourcesandgeoscience.nsw.gov.au/landholders-and-community/minerals-and-coal/legacy-mines-program/case-studies/captains-flat-lake-george-mine accessed 23 September 2021

[2] Ramboll 2020, Captains Flat Rail Corridor Environmental Site Assessment

[3] Ramboll 2021, Captains Flat Rail Corridor Preliminary Site Investigation

- Collection of quality control samples for laboratory analysis
- Comparison of results against tier 1 assessment criteria and
- Preparation of this report.

The operational rail line was excluded from assessment.

2. SITE IDENTIFICATION

2.1 Site Identification

Site details are summarised in Table 2-1. The site locality is presented in Figure 1, Appendix 1.

Table 2-1: Site Identification

Information	Description
Street Address:	20 Majara Street, Bungendore, NSW
Identifier:	Part Lot 2 Deposited Plan (DP) 814518 and Part Lot 4 DP830878 and the rail corridor at Bungendore Station.
Site Area:	Approximately 1.3 hectares (Ha)
Local Government:	Queanbeyan–Palerang Regional Council
Owner:	Managed by JHR as part of the CRN
Current Site Use:	Operational rail corridor

2.2 Site Details

The site comprises the western portion of the Bungendore Train Station and surrounding areas within the CRN. The Bungendore train station services the operational Goulburn-Bombala line however also historically serviced the Captains Flat to Bungendore line between 1940 and 1969 where trains carried ore from the former Lake George Mine.

2.3 Zoning

Review of Palerang Local Environmental Plan 2014 identifies the site is zoned SP2 Rail Infrastructure Facility.

2.4 Surrounding Land Use

The site is located off Majara Street in an area surrounded by land predominately zoned R1 General Residential, R2 Low Density Residential and RE1 Public Recreation.

Surrounding land use includes:

- North: Rail corridor and sports fields.
- East: Rail corridor and residential properties.
- South: Rail corridor and evidence of a former railway yard or siding.
- West: Primary School, sports oval, and mixed residential and commercial properties.

2.5 Environmental Protection Licence

Based on a search of the NSW Environment Protection Authority (EPA) public register (http://www.epa.nsw.gov.au/prpoeoapp/ 23/09/2020) the site forms part of a licensed premises regulated under EPL 13421. The licensed premise includes Country Regional Network operational and non-operational track.

2.6 NSW EPA Records

A search of the 'List of NSW contaminated sites notified to EPA' and the 'Contaminated Land: Record of Notices' current at 23 September 2021 indicates that contamination on or within

1,000 m of the site has not been notified to the EPA and is not regulated by the EPA under the CLM Act 1997.

3. SITE CONDITION AND SURROUNDING ENVIRONMENT

3.1 Topography

Based on information sourced from NSW base maps the site topography appears to be flat with a gentle slope down to the south west. Topographical contours are presented on Figure 1, Appendix 1.

3.2 Geology

According to the NSW Geological Survey (2018) 1:500,000 geology map the site is underlain by Ordovician sedimentary rocks.

3.3 Hydrogeology

A review of the Bureau of Meteorology's National Groundwater Information System (BOM, 2019) indicated that four registered groundwater bores are located within 500 m of the site and a summary of the details contained within the summary reports is presented below:

- Three of the bores were used for domestic purposes and one for monitoring purposes.
- The total drilled depth ranged between 5.1 m - 50 m.
- Standing water level ranged between 4.3 m – 28 m.
- Lithology comprised mainly clay, sand and gravel with water bearing zones reported in gravel.

The Hydrogeology Map of Australia (Geoscience Australia, 2000) indicates the site is within an area of fractured or fissured aquifers of low to moderate productivity.

3.4 Site Inspection

A site inspection was completed by Ramboll environmental scientists experienced in assessment of contaminated sites on 13 February 2021. The following items were noted:

- Site topography was relatively flat with a hill to the north of the site where the rail corridor cuts into the hillside.
- The site comprised the Bungendore Station and rail corridor, unsealed car park and roads and adjacent grassland.
- Evidence of some potential ore and mine waste was present in the southern portion of the site in an area which may have historically joined the existing unsealed road for access off of Malbon Street.
- A drainage swale ran along the western site boundary however no water was observed in the swale during the inspection.

Site photos are presented in Appendix 2.

4. ASSESSMENT CRITERIA

4.1 Soil

The NEPM (2013) provides health-based soil investigation levels (HILs) and ecological investigation levels (EILs) for various land uses. Based on the current land use as a railway station, the assessment criteria adopted for the site are as follows:

- HIL D – HIL for commercial / industrial such as shops, offices, factories and industrial sites. The HILs are applicable for assessing human health risk via all relevant pathways of exposure. The HILs are generic to all soil types and apply generally to a depth of 3 mbgl for industrial use.
- EIL for commercial / industrial. No site specific soil parameters were collected so generic EILs were used.

The soil assessment criteria are summarised in Table 4-1.

Table 4-1: Soil Assessment Criteria (mg/kg)

Contaminant	HIL D	Generic EIL
Arsenic	3,000	160
Chromium	3,600[a]	-
Copper	240,000	-
Iron	-	-
Lead	1,500	1,800
Nickel	6,000	-
Zinc	400,000	-

- Indicates no criteria available

[a]HIL for chromium (VI)

5. SAMPLING AND ANALYSIS QUALITY PLAN

5.1 Data Quality Objectives

To achieve the objectives and purpose of the investigation, both the field and laboratory programs must result in data that is representative of the conditions at the site. As such, specific Data Quality Objectives (DQOs) have been developed for the tasks to be completed. The DQO process is a systematic, seven step process that defines the criteria that the validation sampling should satisfy in accordance with the *Guidelines for the NSW Site Auditor Scheme (3rd Edition)* (NSW EPA 2017).

The seven step DQOs process comprises:

1. State the problem;
2. Identify the decisions/ goal of the study;
3. Identify the information inputs;
4. Define the boundaries of the study;
5. Develop the decision rules or analytical approach;
6. Specify the performance or acceptance criteria;
7. Develop the plan for obtaining data.

The seven step DQO process has been completed for sampling at the site and is outlined in Table 5-1.

Table 5-1: Data Quality Objectives

DQO	Outcome
Step1: State the Problem	Historic rail transport of ore concentrates may have contaminated the site.
Step 2: Identify the Decision	To assess the potential presence of contaminant exposure risks at or originating from the site related to the historic transport of ore concentrates by rail.
Step 3: Identify the Information Inputs	• QA/QC as described in Table 5-2 to assess whether the data collected is of sufficient quality to meet the project objectives. • Preliminary assessment of contaminant migration and exposure pathways and receptors on site and within the surrounding environment to inform assessment of whether potential risks to human health or the environment exist. • Contaminant concentrations on site boundaries to inform assessment of the fate and transport of contaminants off site.
Step 4: Define the Study Boundaries	Spatial boundaries: The site comprised Part Lot 2 Deposited Plan (DP) 814518, Part Lot 4 DP830878 and the rail corridor at Bungendore Station, as defined in Figure 1, Appendix 1. Vertical boundaries: The vertical boundary of the site was limited to shallow site soils. Temporal boundaries: The temporal boundary was limited to the time at which the ESA was completed.
Step 5: Develop a Decision Rule	The decision rules for this assessment are as follows: • If it is determined that the data generated through this investigation is reliable, complete, comparable, accurate and representative then this information will be used to address the project objectives. • If it is determined that the data generated through this investigation is not suitable, comprehensive or reliable, for use in achieving the project objectives, then further investigations may be recommended to reduce uncertainties. • If it is determined that insufficient information is available to make conclusions, then further information may be required. • If concentrations are above guidelines then consider if further investigation, remediation or management is required.
Step 6: Specify Limits of Decision Errors	The acceptable limits on decision error are as follows: • A 5% probability of a false negative (i.e. assessing that the average concentrations of identified CoPC are less than the assessment criteria when they are actually not). • A 5% probability of a false positive (i.e. assessing that the average concentrations of identified CoPC are more than the assessment criteria when they actually are not).
Step 7: Optimise the Design for Obtaining Data	Refer to Section 5.2

5.2 Sampling Plan

The sampling plan for the soil investigation completed under this ESA comprised:

- Systematic FPXRF sampling in-situ at surface at 44 locations on an approximate 18 m grid across the site
- Targeted FPXRF sampling in-situ at surface at three locations where elevated lead was observed at surface
- Sampling and laboratory analyses from 5% of the FPXRF locations for arsenic, chromium, copper, iron, lead and zinc.

The sampling was designed in accordance with the minimum sampling density presented in the NSW Sampling Design Guidelines (NSW EPA, 1998). For a site area of 1.3 hectares a minimum of approximately 23 sampling locations are required.

5.3 Data Quality Indicators

Data Quality Indicators (DQIs) have been established to set acceptance limits on field and laboratory data collected as part of the soil investigation. The DQIs are outlined in Table 5-2.

Table 5-2: Data Quality Indicators

DQI	Field	Laboratory
Completeness – a measure of the amount of usable data from a data collection activity	All critical locations sampled. Experienced sampler. Documentation complete and correct, including field logs, chain of custody documentation recording of FPXRF data.	All critical samples analysed. All analysis completed according to standard operating procedures. Appropriate methods. Appropriate Practical Quantitation Limits (PQLs)
Comparability – the confidence that data may be considered to be equivalent for each sampling and analytical event	Experienced sampler. Same types of samples collected using approved sampling methods. Correlation co-efficient (R^2) for FPXRF and laboratory results for lead of $\geq$ 0.7 (US EPA 2007).	Same analytical methods used. Same sample PQLs. Same NATA accredited laboratory used. Same units.
Representativeness – the confidence that data are representative of each medium present onsite	Appropriate media sampled.	All sampled analysed according to standard operating procedures.
Precision - a quantitative measure of the variability of the data	Collection of laboratory QC samples at a rate of one in 20 FPXRF samples.	Laboratory duplicates analysed, RPDs to be within ≤30 %.
Accuracy – a quantitative measure of the closeness of the reported data to the 'true' value	Sampling methodologies appropriate and complied with. Daily system checks. Measurement of blanks and certified reference materials.	Analysis of replicate samples, method blanks, surrogate spikes and laboratory quality control samples.

6. QUALITY ASSURANCE AND QUALITY CONTROL

6.1 QA/QC Data Evaluation

An assessment was made of data completeness, comparability, representativeness, precision and accuracy based on field and laboratory considerations, as outlined in NEPM 1999 Amendment (2013) guidelines. Assessment of the DQIs of completeness, comparability, representativeness, precision and accuracy is made in Table 6-1.

Table 6-1: QA/QC – Assessment of DQIs

DQI	Ramboll Assessment
Completeness	Sampling was conducted in accordance with frequencies proposed within the NSW Sampling Design Guidelines (1995) for a site of area 1.3 hectares a minimum of 23 sampling locations are required. The sampling completed was considered sufficient to develop a preliminary CSM and to identify remediation or management of contamination required at the site. Within this context the sampling program that was implemented is considered sufficiently complete to address project objectives.
Comparability	The field investigation was completed by experienced personnel in general accordance with sampling methodology guidance described in Section 5.2. FPXRF measurements were completed with a calibrated instrument (calibration certificate provided in Appendix 3) and response regularly checked using certified reference material. The laboratory analysis was undertaken by a NATA registered laboratory using accredited analytical methods. FPXRF measurements reported in parts per million (ppm) were corrected for the % moisture content reported in laboratory check samples to inform assessment of dry weight (mg/kg) contaminant concentrations. The moisture correction which was applied to FPXRF measurements is described by the following formula: Moisture corrected FPXRF = Uncorrected FPXRF/(100 − moisture content)*100 The average moisture content was generally applied to uncorrected FPXRF measurements however where laboratory check samples were collected, the specific moisture content reported in these samples was applied to the corresponding FPXRF data. Correlation co-efficients (R^2) between moisture corrected FPXRF and laboratory samples were then calculated for COPC. Data sets, scatter plots and R^2 values are presented in Appendix 5. For lead the R^2 between moisture corrected FPXRF and laboratory samples was calculated at 0.94.
Representativeness	In the field, representativeness was achieved by completing the sampling described under Completeness above. It is noted however that the operational rail formation was excluded from the site and that contamination may exist in this area and other surrounding areas of the CRN.
Precision	The precision of the FPXRF results can be improved by extending the dwell time of the measurement. A dwell of 60 seconds was adopted during sampling and was considered to provide sufficient precision for the sampling program. In order to further ensure precision in the field FPXRF the following controls were implemented: • FPXRF measurements were collected by an experienced environmental scientist holding a NSW EPA license required for field based XRF testing • FPXRF measurements were collected from soil in-situ and measurements were taken by placing the FPXRF directly on the ground surface • The soil surface was cleared of debris and grass prior to taking the measurement to ensure that there was no obstruction, that the analyser window is protected and that contact with the sample surface was maintained during measurements • As moisture is known to affect measured concentrations, visually dry surfaces were chosen for measurement wherever feasible Soil sampling for confirmatory laboratory analyses occurred at a rate of one every five FPXRF samples. This included:

DQI	Ramboll Assessment
Accuracy	• Collection of samples by a suitably experienced environmental scientist • Disposable nitrile rubber gloves were worn during sample collection and changed between sampling locations • Soil samples were placed directly into laboratory supplied sampling containers and stored on ice in insulated coolers in the field and during transportation to the laboratory • Sample identification, date and analytical requirements were recorded on chain of custody documents. • Samples were transported under chain of custody conditions to a laboratory with NATA accreditation for COPCs. Internal laboratory analytical precision was assessed by sub-sampling primary samples to create laboratory duplicates. Internal precision was assessed through relative percentage difference (RPD) between laboratory duplicates and primary samples. Recovery limits are defined in accordance with the laboratory's NATA certified methods though is based on 70%-130% RPD. At the laboratory, precision was achieved using laboratory control samples, method blanks and laboratory spikes. Accuracy was achieved in the field by ensuring appropriate sampling methodologies were utilised and complied with. Works were completed in accordance with Method 6200, Field Portable X-Ray Fluorescence Spectrometry for the Determination of Elemental Concentrations in Soil and Sediment (US EPA 2007). Accuracy of FPXRF data was measured through: • Daily system checks and internal calibration as recommended by the instrument manual. • Measurement of blank reference material (silicon dioxide, SiO2) – this was done at the start of the day and repeated every 10 samples. This was completed to mitigate potential inaccuracies associated with cross-contamination of samples. The analyzer window was also cleaned regularly to prevent cross-contamination. • Certified reference materials were measured to check instrument response and calibration. This was conducted every 25 samples. At the laboratory, accuracy was assessed by analysing blind field replicate samples (and then assessing relative percentage differences with primary samples) and laboratory duplicates.

The sampling methods implemented are described in Section 7 and demonstrate general accordance with relevant guidance documents. Based on this, field quality QA is considered adequate. An assessment of field QC and laboratory QA/QC is presented in Table 6-2.

Table 6-2: QA/QC – Field and Laboratory Quality Assurance and Quality Control

Field and Lab QA/QC	Ramboll Comments
Field quality control samples	Duplicate and triplicate FPXRF measurements were conducted on select soil samples. Daily system checks and internal calibration was also conducted as recommended by the instrument manual. Certified reference material (CRM) and reference blank samples were analysed in the field at a rate of 1 in 10. Laboratory QA samples were analysed at a rate of 20.4% of total FPXRF samples. This exceeds recommendation for a minimum 5% as presented in the USEPA (NEPC 2013). Results of the above QC samples are shown in Appendix 6.
Field quality control results	The following field duplicate (between XRF measurement and primary lab measurement) sample pairs reported relative percentage difference (RPD) exceedances (≤30%): • Arsenic – 118% for BSX24/QA39. • Chromium – 85% for BSX10/QA35. • Copper – 40% for BSX37/QA43. • Lead – 53% for BSX10/QA35. • Zinc – 61% and 52% for BSX24/QA39 and BSX37/QA43.

Field and Lab QA/QC	Ramboll Comments
	The following interlab duplicate sample pairs reported relative percentage difference (RPD) exceedances (≤30%): • Arsenic – 46%, 188% and 198% for QA35/QA36, QA39/QA40 and QA43/QA44 respectively. • Chromium – 51% and 32% for QA39/QA40 and QA43/QA44 respectively. • Copper – 79% and 159% for QA39/QA40 and QA43/QA44 respectively. • Lead– 40%, 46% and 192% for QA35/QA36, QA39/QA40 and QA43/QA44 respectively. • Nickel – 75% and 114% for QA39/QA40 and QA43/QA44 respectively. • Zinc – 54%, 114% and 175% for QA35/QA36, QA39/QA40 and QA43/QA44 respectively. The higher values in each instance were adopted as a conservative approach. The RPD exceedances are likely due to heterogeneous distribution of contamination and difficulty in replication between laboratories with high concentrations of heavy metals. Lower RPDs were reported in the XRF and lab duplicate pairs and indicates the replicability errors are likely due to lab method errors. The soil surface though may also have resulted from high moisture content (average 1.1 %, maximum 22%). All FPXRF systems checks were passed. The FPXRF analysis of SiO2 blank had less than limit-of-detection (LOD) for all CoPCs. The FPXRF analysis of certified reference material reported no RPD exceedances for arsenic and lead. FPXRF calibration certificates, blank and CRM certificates are provided in Appendix 3.
NATA registered laboratory and NATA endorsed methods	Eurofins MGT was used as the primary laboratory. Envirolab was used as the secondary laboratory. The laboratory certificates are NATA stamped.
Analytical methods	Summary analytical methods were included in the laboratory test certificates as shown in Appendix 5.
Holding times	Review of the COCs and laboratory certificates indicated that holding times were met
Practical Quantitation Limits (PQLs)	PQLs for all analyses were below the site screening criteria.
Laboratory quality control samples	Laboratory quality control samples including duplicates, laboratory control samples, matrix spikes, and method blanks were undertaken by the laboratories at appropriate frequencies for soil samples. Results passed acceptance criteria and support reliance on collected data.

Laboratory reports are presented as Appendix 5.

Overall, it is considered that the completed investigation works, and the data obtained adequately complied with the requirements of NEPM 1999 Amendment (2013) guidelines. Concentrations measured by FPXRF are also considered to be of acceptable quality and appropriate for assessment of onsite risks.

6.2 Uncertainties

The FPXRF analysis, like analytical techniques, can suffer from several interferences and factors that can introduce uncertainties in the results. This can affect the accuracy and precision of the instrument. Some of the important factors that were considered were:

- Moisture – sample moisture can cause results of the analysis to be under reported. This can be accounted for by measuring the sample moisture content and applying moisture correction to the results. During field measurements the surface soil was found to be

    - damp and wet in some locations due to previous rainfall. The laboratory soil sample
    - analysis showed that soil moisture was variable and > 20% at sample location BSX37/QA43/QA44. The soil sample was taken from fill within the rail corridor and may have been influenced by recent rain.

  To account for the higher moisture in some of the samples and to reliably assess site related risks, the FPXRF concentrations for the COPC were corrected with average moisture (9.8%).
- Sample heterogeneity can also be a source of uncertainty. The FPXRF results indicate contaminant concentrations in soil were heterogeneous. FPXRF takes measurements on a relatively small sample area of a few millimetres in size. The effective analysis depth (depth from which 99% of the XRF signal originates) can also vary based on organic carbon content, soil moisture and other soil variables. The effect of this is that the volume of soil measured by FPXRF is relatively small compared with the soil volume sampled for laboratory analysis. Therefore, small scale heterogeneity is averaged (diluted) to lower concentrations in a homogenised laboratory sample of larger volume (as a deeper and wider soil area is sampled for laboratory measurement).
- Inconsistent positioning of the XRF analyser can cause deviations in signal path distances, which can introduce errors. To eliminate this source of error, it was ensured that the FPXRF positioning was consistent between samples and always in contact with the surface.
- XRF can also suffer from spectra interferences where spectral lines from different elements can overlap. The Niton analyser uses a 50kV x-ray source to provide sufficient resolution to accurately quantify lead spectral lines.

7. FIELDWORK

Fieldwork was completed on 13 February 2021 by an environmental engineer suitably experienced and qualified in assessment of site contamination integrating FPXRF measurement of metals in soil and collection of various laboratory samples. Further description of specific elements of the fieldwork is presented below.

7.1.1 Portable XRF Measurements

A ThermoFisher Scientific Niton™ XL3t XRF analyser was used for undertaking soil measurements. The instrument was used in soil mode and data was collected using 60 second dwell. The analyser uses a 50kV x-ray tube which provides sufficient flux to enable separation of spectra lines for highly accurate quantification of elements of interest.

FPXRF readings were completed by a suitably experienced scientist holding an NSW EPA license required for field based XRF testing. Testing was completed in accordance with relevant provisions described in US EPA method 6200 (USEPA 2007).

The FPXRF was used in-situ and measurements were taken by placing the FPXRF directly on surface soil. The soil surface to be measured was cleared of debris and grass prior to taking the measurement. This was to ensure that there was no obstruction, the analyser window was protected and maintained the required contact with the sample surface during measurements. As moisture is known to affect measured concentrations (see uncertainty section), visually dry surfaces were chosen for measurement.

Readings were recorded digitally on the FPXRF unit and are reported as a wet weight and are not directly comparable with the dry weight guideline concentration. As the laboratory measurements showed that soil moisture was relatively high, all FPXRF readings were moisture corrected to convert concentrations to dry weight basis.

The sampling program was adjusted based on review of FPXRF lead readings in the field to assess contamination at sources, along pathways and adjacent receptors. The sampling completed was sufficient to develop a preliminary CSM and to identify remediation or management required and therefore meets the project objectives.

7.1.2 Soil Sampling

Soil samples for laboratory analysis were collected by hand per frequency nominated in the SAQP section and in general accordance with *AS 4482.1-2005* (Standards Australia 2005). Three shallow hand augers were advanced using a hand trowel in soil in the southern portion of the site to assess the depth of impacts. Fresh disposable nitrile rubber gloves were used to collect each sample. The hand trowel was rinsed with Decon90 solution and rinsed with potable water between location. Samples were stored in laboratory supplied glass sample jars, labelled with unique identifiers which were cross-referenced with on-site plans and submitted to the laboratory under chain of custody. A rinsate sample was completed on the hand trowel upon the completion of fieldwork.

8. FIELD AND ANALYTICAL RESULTS

8.1 Soil Observations

The highest contaminant concentrations observed through FPXRF measurement were generally associated with the portion of the site nearby the rail formation and the southern portion of the site where fill was present.

8.2 Soil Results

The raw FPXRF data for all metals is provided in Appendix 5. Measured contaminant concentrations were assessed against Tier 1 assessment criteria for commercial/industrial use as presented in Appendix 6. Exceedances are also shown on Figure 1, Appendix 1. FPXRF results are summarised in Table 8-1.

Table 8-1: Summary of Soil Metals Results[4]

	Number of Samples	Detections	Minimum	Maximum	Mean	No > HIL D	No > EIL Commercial / Industrial
Metals							
Arsenic	49	17	<LOD	2,983	426	0	10
Chromium	49	21	<LOD	82	41	0	-
Copper	49	17	<LOD	1008	300	0	-
Iron	49	49	4,500	62,911	19684	-	-
Lead	49	41	<LOD	10,770	1274	14	11
Nickel	49	1	<LOD	66	66	0	-
Zinc	49	33	<LOD	7,286	660	0	-

Elevated lead concentrations exceeded the human health criteria for commercial industrial land use at 13 locations (in 14 samples) as follows:

- Five locations in the southern portion of the site.
- Eight locations along the rail formation to the north of the site.

The highest lead concentration was identified at BSX25 (10,770 ppm) which exceeded the site criteria for human health by more than 7-times. BSX25 is located in the southern portion of the site where the suspected old access road to Bungendore Station is.

Arsenic, chromium, copper, nickel and zinc did not exceed the respective HIL values for commercial/industrial land use.

EIL exceedances were reported for arsenic and lead and were identified at locations similar to health exceedances across the site.

[4] Analytical results are not included in this table as these were completed for the purpose of validating FPXRF results only. As the FPXRF results have been demonstrated to be accurate these results are included in the table.

9. DISCUSSION OF RESULTS

Elevated lead concentrations were observed in two areas of the site and appear to be associated with a southern portion of the site and the operational rail formation. The source of contamination is thought to be from historic transport of ore by rail through the site and potential for ore spills or dust deposition around the site as represented by elevated lead concentrations presented on Figure 2, Appendix 1.

There were no health-based exceedances to the lead criteria in three samples from 0.1 m depth and this indicates the contamination may be limited to shallow depth. Further investigations would be required to confirm.

The extent of investigation completed at the site was limited however based on the sampling completed and the use of the site as a railway station, there are potential risks to human and ecological receptors.

10. CONCLUSIONS AND RECOMMENDATIONS

Ramboll was engaged by JHR on behalf of TfNSW to assess at the operational Bungendore Train Station and surrounding rail corridor which forms part of the CRN located at Bungendore, NSW.

Several exceedances of the HIL for lead were observed in the southern portion of the site near a suspected former access road and in the north along the operational railway line. All exceedances to the HIL were reported at less than 0.1 m depth and it's considered the impacts may be limited to shallow soils.

Key recommendations are:

- Land south of the southern driveway entrance to Bungendore Station be isolated from public access as shown in Figure 2.
- A Preliminary Site Investigation should be completed in accordance with the National Environment Protection Measure (NEPC 2013) and the Consultants Reporting on Contaminated Land – Contaminated Land Guidelines (NSW EPA 2020) to consolidate background information relevant to assessment of the nature and extent of contamination at the site.
- A Detailed Site Investigation should then be completed to characterise the degree and extent of site contamination, associated risks to human health and the environment and drivers for remediation.
- Further assessments should inform the potential Duty to Report contamination under the Contaminated Land Management Act

11. LIMITATIONS

Ramboll Australia Pty Ltd (Ramboll) prepared this report in accordance with the scope of work as outlined in our proposal to JHR dated 11 August 2020 and in accordance with our understanding and interpretation of current regulatory standards.

A representative program of sampling and laboratory analyses was undertaken as part of this investigation, based on past and present known uses of the site (the site and 26 Goulburn St. site). While every care has been taken, concentrations of contaminants measured may not be representative of conditions between the locations sampled and investigated. We cannot therefore preclude the presence of materials that may be hazardous. Site conditions may change over time. This report is based on conditions encountered at the Site at the time of the report and Ramboll disclaims responsibility for any changes that may have occurred after this time.

The conclusions presented in this report represent Ramboll's professional judgment based on information made available during the course of this assignment and are true and correct to the best of Ramboll's knowledge as at the date of the assessment.

Ramboll did not independently verify all of the written or oral information provided to Ramboll during the course of this investigation. While Ramboll has no reason to doubt the accuracy of the information provided to it, the report is complete and accurate only to the extent that the information provided to Ramboll was itself complete and accurate.

This report does not purport to give legal advice. This advice can only be given by qualified legal advisors.

11.1 User Reliance

This report has been prepared exclusively for JHR and may not be relied upon by any other person or entity without Ramboll's express written permission.

This certificate is issued in accordance with Thermo Fisher Scientific factory specifications.
The measurements were found to be within specification limits at the time of calibration.
This certificate is valid for 2 years from the date of calibration.

Standards are traceable to National Institute of Standards & Technology (NIST) standards.
**** - Not Certified**

Signed:

Dave Scattergood
Service Manager

Sample Information

✓	A detailed list of analytes logged into our LIMS, is included in the attached summary table.
✓	All samples have been received as described on the above COC.
✓	COC has been completed correctly.
✓	Attempt to chill was evident.
✓	Appropriately preserved sample containers have been used.
✓	All samples were received in good condition.
✓	Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.
✓	Appropriate sample containers have been used.
✓	Sample containers for volatile analysis received with zero headspace.
✓	Split sample sent to requested external lab.
✗	Some samples have been subcontracted.
N/A	Custody Seals intact (if used).

Notes

QA36, QA40 & QA44 forwarded to Envirolab for analysis.

Contact

If you have any questions with respect to these samples, please contact your Analytical Services Manager:

Andrew Black on phone : (+61) 2 9900 8490 or by email: AndrewBlack@eurofins.com

Results will be delivered electronically via email to Stephen Maxwell - smaxwell@ramboll.com.

Note: A copy of these results will also be delivered to the general Ramboll Australia Pty Ltd email address.

Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported.
A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results.

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples follows guidelines delineated in the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended May 2013 and are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil/sediment/solid results are reported on a dry basis, unless otherwise stated.
3. All biota/food results are reported on a wet weight basis on the edible portion, unless otherwise stated.
4. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
5. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds.
6. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
7. Samples were analysed on an 'as received' basis.
8. Information identified on this report with blue colour, indicates data provided by customer, that may have an impact on the results.
9. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether the holding time is 7 days however for all other VOCs such as BTEX or C6-10 TRH then the holding time is 14 days.

****NOTE:** pH duplicates are reported as a range NOT as RPD

Units

mg/kg: milligrams per kilogram

mg/L: milligrams per litre

ug/L: micrograms per litre

ppm: Parts per million

ppb: Parts per billion

%: Percentage

org/100mL: Organisms per 100 millilitres

NTU: Nephelometric Turbidity Units

MPN/100mL: Most Probable Number of organisms per 100 millilitres

Terms

Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery.
CRM	Certified Reference Material - reported as percent recovery.
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands and in the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
QSM	US Department of Defense Quality Systems Manual Version 5.3
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within.
TEQ	Toxic Equivalency Quotient

QC - Acceptance Criteria

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries: Recoveries must lie between 20-130% Phenols & 50-150% PFASs

PFAS field samples that contain surrogate recoveries in excess of the QC limit designated in QSM 5.3 where no positive PFAS results have been reported have been reviewed and no data was affected.

WA DWER (n=10): PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

QC Data General Comments

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. Organochlorine Pesticide analysis - where reporting LCS data, Toxaphene & Chlordane are not added to the LCS.
4. Organochlorine Pesticide analysis - where reporting Spike data, Toxaphene is not added to the Spike.
5. Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
6. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling.Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
7. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
8. Polychlorinated Biphenyls are spiked only using Aroclor 1260 in Matrix Spikes and LCS.
9. For Matrix Spikes and LCS results a dash " -" in the report means that the specific analyte was not added to the QC sample.
10. Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
Q15	The RPD reported passes Eurofins Environment Testing's QC - Acceptance Criteria as defined in the Internal Quality Control Review and Glossary page of this report.

CERTIFICATE OF ANALYSIS 262265

Client Details

Client	Ramboll Australia Pty Ltd
Attention	Stephen Maxwell
Address	PO Box 560, North Sydney, NSW, 2060

Sample Details

Your Reference	**318001025_4**
Number of Samples	3 Soil
Date samples received	19/02/2021
Date completed instructions received	19/02/2021

Analysis Details

Please refer to the following pages for results, methodology summary and quality control data.

Samples were analysed as received from the client. Results relate specifically to the samples as received.

Results are reported on a dry weight basis for solids and on an as received basis for other matrices.

Report Details

Date results requested by	26/02/2021
Date of Issue	26/02/2021

NATA Accreditation Number 2901. This document shall not be reproduced except in full.

Accredited for compliance with ISO/IEC 17025 - Testing. **Tests not covered by NATA are denoted with ***

Results Approved By
Jaimie Loa-Kum-Cheung, Metals Supervisor
Steven Luong, Organics Supervisor

Result Definitions

NT	Not tested
NA	Test not required
INS	Insufficient sample for this test
PQL	Practical Quantitation Limit
<	Less than
>	Greater than
RPD	Relative Percent Difference
LCS	Laboratory Control Sample
NS	Not specified
NEPM	National Environmental Protection Measure
NR	Not Reported

Quality Control Definitions

Blank	This is the component of the analytical signal which is not derived from the sample but from reagents, glassware etc, can be determined by processing solvents and reagents in exactly the same manner as for samples.
Duplicate	This is the complete duplicate analysis of a sample from the process batch. If possible, the sample selected should be one where the analyte concentration is easily measurable.
Matrix Spike	A portion of the sample is spiked with a known concentration of target analyte. The purpose of the matrix spike is to monitor the performance of the analytical method used and to determine whether matrix interferences exist.
LCS (Laboratory Control Sample)	This comprises either a standard reference material or a control matrix (such as a blank sand or water) fortified with analytes representative of the analyte class. It is simply a check sample.
Surrogate Spike	Surrogates are known additions to each sample, blank, matrix spike and LCS in a batch, of compounds which are similar to the analyte of interest, however are not expected to be found in real samples.

Australian Drinking Water Guidelines recommend that Thermotolerant Coliform, Faecal Enterococci, & E.Coli levels are less than 1cfu/100mL. The recommended maximums are taken from "Australian Drinking Water Guidelines", published by NHMRC & ARMC 2011.

The recommended maximums for analytes in urine are taken from “2018 TLVs and BEIs”, as published by ACGIH (where available). Limit provided for Nickel is a precautionary guideline as per Position Paper prepared by AIOH Exposure Standards Committee, 2016.

Guideline limits for Rinse Water Quality reported as per analytical requirements and specifications of AS 4187, Amdt 2 2019, Table 7.2

Laboratory Acceptance Criteria

Duplicate sample and matrix spike recoveries may not be reported on smaller jobs, however, were analysed at a frequency to meet or exceed NEPM requirements. All samples are tested in batches of 20. The duplicate sample RPD and matrix spike recoveries for the batch were within the laboratory acceptance criteria.

Filters, swabs, wipes, tubes and badges will not have duplicate data as the whole sample is generally extracted during sample extraction.

Spikes for Physical and Aggregate Tests are not applicable.

For VOCs in water samples, three vials are required for duplicate or spike analysis.

Duplicates: >10xPQL - RPD acceptance criteria will vary depending on the analytes and the analytical techniques but is typically in the range 20%-50% – see ELN-P05 QA/QC tables for details; <10xPQL - RPD are higher as the results approach PQL and the estimated measurement uncertainty will statistically increase.

Matrix Spikes, LCS and Surrogate recoveries: Generally 70-130% for inorganics/metals (not SPOCAS); 60-140% for organics/SPOCAS (+/-50% surrogates) and 10-140% for labile SVOCs (including labile surrogates), ultra trace organics and speciated phenols is acceptable.

In circumstances where no duplicate and/or sample spike has been reported at 1 in 10 and/or 1 in 20 samples respectively, the sample volume submitted was insufficient in order to satisfy laboratory QA/QC protocols.

When samples are received where certain analytes are outside of recommended technical holding times (THTs), the analysis has proceeded. Where analytes are on the verge of breaching THTs, every effort will be made to analyse within the THT or as soon as practicable.

Where sampling dates are not provided, Envirolab are not in a position to comment on the validity of the analysis where recommended technical holding times may have been breached.

Measurement Uncertainty estimates are available for most tests upon request.

Analysis of aqueous samples typically involves the extraction/digestion and/or analysis of the liquid phase only (i.e. NOT any settled sediment phase but inclusive of suspended particles if present), unless stipulated on the Envirolab COC and/or by correspondence. Notable exceptions include certain Physical Tests (pH/EC/BOD/COD/Apparent Colour etc.), Solids testing, total recoverable metals and PFAS where solids are included by default.

Samples for Microbiological analysis (not Amoeba forms) received outside of the 2-8°C temperature range do not meet the ideal cooling conditions as stated in AS2031-2012.

Lead	45	26	53%	3770	3500	7%	5740	4300	29%	26	39	40%	3500	2200	46%	4300	90	192%	<LOD	<LOD	<LOD	440	457	454	445
Nickel	< LOD	9	-	< LOD	8	-	< LOD	22	-	9	4	75%	8	10	23%	22	6	114%	<LOD	<LOD	<LOD	< LOD	< LOD	< LOD	< LOD
Zinc	< LOD	26	-	1331	710	61%	7286	4300	52%	26	45	54%	710	2600	114%	4300	290	175%	<LOD	<LOD	<LOD	< LOD	< LOD	< LOD	< LOD

Note all units in ppm unless stated otherwise
<LOD = Less than Limit of Detection
<LOR = Less than laboratory Limit of Reporting

Reference RPD for Lead	13%	9%	10%	12%

ERM has over 160 offices across the following countries and territories worldwide

Argentina
Australia
Belgium
Brazil
Canada
Chile
China
Colombia
France
Germany
Ghana
Guyana
Hong Kong
India
Indonesia
Ireland
Italy
Japan
Kazakhstan
Kenya
Malaysia
Mexico
Mozambique
Myanmar
The Netherlands
New Zealand
Norway
Panama
Peru
Poland
Portugal
Puerto Rico
Romania
Russia
Senegal
Singapore
South Africa
South Korea
Spain
Sweden
Switzerland
Taiwan
