# 1 Introduction

---

## 1.1 Project description

A Photographic Archival Recording has been prepared for the Windsor Bridge Demolition, within the context of the Windsor Bridge Replacement Project (WBRP). The purpose of the report is to photographically record key methodologies and materials associated with the removal of the former bridge. Specifically, this document is in fulfilment of a required during-works archival recording, outlined as per the following Ministers Conditions of Approval (relevant section underlined):

- B2. Prior to the commencement of pre-construction works on the southern side of the Hawkesbury River, The applicant shall complete a detailed **Archival Recording** of all historic heritage sites within the Strategic Conservation Management Plan study area in accordance with the Guidelines issued by the NSW Heritage Council and to the satisfaction of the Director-General issued by the Heritage NSW Council and o the satisfaction of the Director General and in consultation with the NSW Heritage Council. The recording shall include, but not be limited to:
- (a) Detailed survey and analysis of Thompson Square Conservation Area, Windsor bridge and the immediate surrounds using 3ED laser scanning; and
  - (b) Photographic and archival recording of all affecting heritage sites, as identified in the specialist reports prepared as part of the Environmental Impact Statement for the Project. Recording is to be completed.

Copies of these recordings should be made available to the Director-General, the NSW Heritage Council, the Local Studies Library and the Local Historical Society in Windsor.

In accordance with the above underlined condition, it is noted that within the Windsor Bridge Replacement Environmental Impact Statement (EIS), under *Section 7.1.5 Environmental management measures*, the following procedures apply:

The 1874 bridge will be dismantled in a manner that allows its construction methods and evolution to be appropriately documented as an archival record prior to, and during its demolition.

This report, in conjunction with the existing Detailed Photographic Archival Recording, provides an appropriate documentation of the former Windsor Bridge prior to and during its demolition. Together, these reports capture the construction methods of the structure and identify fabric from the evolution of the bridge. This satisfies both the Minsters Conditions of Approval and the environmental management measures of the Windsor Bridge Replacement EIS.

## 1.2 Location

The former Windsor Bridge is located on the Hawkesbury River, norther of the town of Windsor. It was formally access from the south by Bridge Street, through Thompson Square, and accessed from the north by Wilberforce Road and Freeman' Reach Road. The former Windsor Bridge is located upstream of the New Windsor Bridge and is intended to be partially retained on the southern embankment to serve as an observation deck.

Figure 1. Roadmap indicating the location of the former Windsor Bridge (marked in red) in relation to the New Windsor Bridge (source: Google maps, overlay by Extent Heritage).

Figure 1. Satellite image showing the location of the former Windsor Bridge (marked in red) in relation to the New Windsor Bridge (source: Nearmap, overlay by Extent Heritage).

### 1.3 Approach and methodology

The methodology used in the preparation of this Photographic Archival Recording is in accordance with the principles and definitions as set out in *The Burra Charter: The Australia ICOMOS Charter for Places of Cultural Significance, 2013 (Burra Charter)* (Australia ICOMOS 2013) and the latest version of the NSW Heritage Branch's Photographic Archival Recording guidelines.

Table 1: Requirements under the "Heritage Information Series: Photographic Recording of Heritage Items Using Film or Digital Capture" report.

Requirement	Compliance
<b>Is there a hard copy report?</b>	Yes.
<b>Does the hard copy report contain:</b>	
<b>a) A thumbnail proof sheet</b>	Yes.
<b>b) Proof sheet properly sleeved in archival protective pages</b>	Yes.
<b>c) Inclusion of electronic storage media with report and images</b>	Yes. A DVD Rom (Archival Gold Disc) has been provided which contains all the images (TIFF and JPGs), a soft copy of the proof sheets, all the measured drawings and a soft copy of this report.
<b>d) Camera, lenses and accessories details</b>	Yes. Cannon AOE D5 and D7 with was used with 10-20mm and 24-80mm lenses. This is referenced in section 3.
<b>e) Archival processing details</b>	In accordance with the guidelines.
<b>f) List of all images, correctly numbered and described</b>	Yes. See section 3.
<b>Is there an electronic report?</b>	Yes. A DVD Rom (Archival Gold Disc) has been provided which contains a soft copy of this report.

<b>How is the information stored?</b>	A DVD Rom (Archival Gold Disc) has been provided which contains all the images (TIFF and JPGs), a soft copy of the proof sheets, all the measured drawings and a soft copy of this report.
<b>Can the storage media be opened?</b>	Yes.
<b>Is the information the same as that contained in the hardcopy report?</b>	Yes.
<b>Are the images saved as RAW or TIFF files, contain metadata and follow guidelines?</b>	<p>Images have been provided in three formats:</p> <ul style="list-style-type: none"> <li>- TIFF</li> <li>- High resolution JPG</li> <li>- Low resolution JPG</li> </ul> <p>All images contain metadata, have been appropriately organised and named.</p>
<b>Is the storage media filed in an acceptable container?</b>	The DVD Rom has been provided in a plastic cover within a certified archival folder.
<b>Is there a full set of 10.5 x 14.8 images processed with archivally stable inks and paper?</b>	Yes. See hard copy report.
<b>Does the report include a brief historical overview of the study area?</b>	Yes. See Section 2.
<b>Have measured drawings been provided?</b>	Yes. See Section 6.

## 1.4 Authorship

This Archival Recording has been prepared by the Austral AHMS Joint Venture (AAJV) Austral AHMS Joint Venture (AAJV) is an unincorporated joint venture of Austral Archaeology Pty Ltd and Extent Heritage Pty Ltd (a merger of Archaeological and Heritage Management Solutions Pty Ltd and Futurepast Heritage Consulting Pty Ltd).

following staff members at Extent Heritage have prepared this Photographic Archival Recording:

- Dr MacLaren North, Managing Director; and
- Ben Calvert, Heritage Advisor.

Historical information in this report was sourced from:

- Austral AHMS Joint Venture (2016). *Thompson Square Strategic Conservation Management Plan*, prepared for Roads and Maritime Services (RMS).

## 1.5 Ownership

The road reserves, former Windsor Bridge, New Windsor bridge and the areas for the new planned bridge approaches are owned by the Roads and Maritime Services branch of Transport for NSW (TfNSW). The Public Domain land of Thompson Square is owned and managed by Hawkesbury City Council.

## 1.6 Heritage Status

### 1.6.1 Listings

The former Windsor Bridge is the subject of two statutory heritage listings. These are outlined in the following table:

**Figure 2. Table showing heritage listings for the place.**

Register/listing	Item listed (Y/N)	Item name	Item number
<b>Statutory listings</b>

Australian Institute of Architects Register of Significant Architecture	N	-	-
Engineering Heritage Register	N	-	-
DOCOMOMO Australia Register	N	-	-

### 1.6.2 Statement of significance

#### Hawkesbury River Bridge, Windsor

This statement of significance has been extracted from the S.170 RMS Heritage and Conservation Register Inventory Sheet for item *Hawkesbury River Bridge, Windsor* (Item No. 5067620):

*The remaining section of the former Windsor Bridge has historic, technical and social significance as important historical and physical fabric in one of the State's pre-eminent historic towns and in the wider Sydney region. It served as a crossing of the Hawkesbury River for 146 years and was twice a major engineering project in the State. In each design, it was specially adapted to the difficulties of crossing of this major waterway, with its frequent floods. The pre-cast reinforced-concrete beam and slab deck erected in the 1920s was an early and innovative use of this technology.*

*The design of the bridge, in its various forms, engaged significant individuals in the history of engineering in NSW, including William Bennett, Commissioner and Engineer-in-Chief for Roads and Bridges from 1863 to 1889, Percy Allan, a distinguished bridge engineer in the Department of Public Works for thirty years, eventually becoming the Chief Engineer, National and Local Government Works in 1918, and Gerald Wilkinson Mitchell, long-serving Manager and Engineer for the State Monier Pipe and Reinforced Concrete Works, who also became Director of the NSW Department of Public Works and General Manager of State Industrial Undertakings in 1930.*

*The former Windsor Bridge played a major role in shaping the history of the Hawkesbury area, as an important link between the communities on either side of the River and as an essential element in an important road route in the development of the Sydney region. In the town with a history stretching back to the earliest days of European settlement, the remaining part of the bridge is an important part of the historic fabric of Windsor and a key element of Windsor's history and identity.*

## 2 Historical context

---

the following historical context has been extracted from the *Windsor Bridge Strategic Conservation Management Plan Volume 1* (2018), prepared for Roads and Maritime Services (RMS).

### 2.1 Windsor Bridge

For the first twenty years of European settlement in the Windsor area, the crossing of the Hawkesbury River occurred only infrequently. A small population and no settlement on the western side meant that there was initially little motivation to cross the river. Over the ensuing decades, expansion of the settlement, particularly after Governor Macquarie's approval of the township of Windsor and the founding of the town of Wilberforce on the northern side of the river in 1810, led to increasing cross-river traffic. A permanent crossing was established in 1814 with the commencement of Howe's Ferry and this service operated under various ownerships for the next sixty years.

#### 2.1.1 A government bridge

During the 1840s and early 1850s in NSW, government buildings and public works were the responsibility of the Colonial Architect's Office and the Colonial Public Works department under the Colonial Engineer. However, subsequent to the establishment of democratic self-government in 1855 and the state's population explosion following the discovery of gold (coinciding with wars and famines in Europe), the demand for public works exceeded the capacity of the Colonial Architect's Office and a new government agency, the Public Works Department (PWD), was established in 1859. There was, naturally, an intention to minimise demands upon the public purse and, typically, the government encouraged private enterprise to provide items of infrastructure such as bridges, except on a small number of designated government roads. The first Pyrmont Bridge, in 1858, and Glebe Island Bridge, in 1860, for example, were built by private companies and their crossing required payment of a toll. In 1857, the Richmond Bridge Company was formed to replace the existing ferry over the Hawkesbury River at North Richmond, and a wooden bridge was built across the river in 1860. It was designed and its construction supervised by E. O. Moriarty, the company's Engineer-in-Chief (also, at that time, Engineer-in-Chief for harbours and river navigation in the NSW Department of Works).

At Windsor, the road to Sydney was one of the 'public roads' of the colony and was administered by a Road Trust. To enter Windsor, a bridge over South Creek was necessary and there had been various structures since the 1820s. In the late 1850s, as the bridge at Richmond was nearing completion, there were several proposals for the formation of a similar company to erect a bridge at Windsor but, as reported in 1864:

*A public meeting, convened by a requisition signed by a number of the leading inhabitants of Windsor, and advertised in Saturday's Herald, took place at the School of Arts on the afternoon of Monday last, for the purpose of considering the propriety of petitioning the Government and Legislature to erect a bridge across the Hawkesbury at Windsor. There was a large attendance, principally of the residents of Wilberforce ... At North Richmond, a most excellent bridge had been erected by a company but it was well known that that company had great difficulties to contend with – that in fact some three or four thousand pounds had been frittered away in its erection at the commencement, and that it had cost nearly double what its projectors originally intended. Up to the present time the proprietors had not received any return, but he was glad to learn that they were now in a fair way of getting interest for their money. The present meeting they would observe had been called to consider the propriety of petitioning the Government to erect a bridge. It would, therefore, be for them to determine whether they would do so or not. In this opinion there would be insurmountable difficulties, in the present depressed state of the*

*district, in the way of getting up any company, and great delay would arise in making the attempt. As to the Government, it seemed they had erected bridges in other parts of the colony – at the Paterson, for instance where they were much less required than at Windsor.<sup>1</sup>*

By October 1864, a petition had been presented to the NSW Parliament by the local Member of the Legislative Assembly, Mr Piddington, and the Under-Secretary for Public Works provided the following reply:

*Department of Public Works, Sydney, 8rd October, 1361.*

*Sir,*

*In reference to the petition presented by you and Mr. Cunneen, from certain of the inhabitants of Windsor and neighbourhood, praying that a bridge may be erected over the Hawkesbury, at Windsor, I am directed by the Secretary for Public Works to Inform you that the Engineer-in-chief for Harbours and Rivers has been instructed to have a survey and soundings made of the river at once, and to submit estimates for an iron and wooden bridge.*

*2. I am to add that if, when these estimates are received, the proposal to erect the bridge meets with the approval of the Government, a sum of money will be placed on the Additional*

*Estimates for 1865, for its construction.*

*I have the honour to be, Sir, your most obedient servant,*

*(Signed) Gerald Halligan, for the Under-Secretary.<sup>2</sup>*

However, successive governments postponed the budget allocation and it was not until 1871 that the funding was finally provided. Moriarty, Engineer-in-Chief for Harbours and River Navigation, advised that there were:

*two sites near the town on either of which the bridge might be erected. Mr. Moriarty said that if the bridge were erected at the site of the present ferry, it would be necessary, on account of the rocky nature of the locale, to construct the bridge of wrought iron piles; but the lower site would only necessitate the use of materials used on ordinary wooden bridges. Some discussion ensued, during which the Engineer-in-Chief stated that the Richmond Bridge cost about £8000; and he had no doubt that a bridge of a similar kind could be constructed at Windsor for £7000. The MINISTER instructed the Engineer-in-Chief to draw up the plans and specifications of both descriptions of bridges, and of the two sites referred to.<sup>3</sup>*

The new bridge opened in 1874 – a timber beam bridge standing on wrought-iron piles. The design was by the Engineer for Roads, W. C. Bennett, and construction was by contractors Messrs Turnbull and Dixon.

*The bridge, or rather the superstructure, is supported by ten iron cylindrical piers, each three feet six inches in diameter, filled with concrete and twenty feet apart, held together with diagonal bracing of channel iron. Its length, exclusive of approaches, is 455 feet and the breadth 20 feet clear. The deck is ironbark planking and the handrail of 1 3/4 inch gaspipe, so erected that each section can be disconnected and let down longitudinally, protecting it from floating debris in*

*time of flood. The operations in connection with the building were commenced about two years and a half ago, and the cost, it is understood, is about £10,000 with the approaches.*<sup>4</sup>

Ten pairs of cylindrical iron piers of 3 feet 6 inches in diameter, filled with cement, were placed 20 feet apart and sunk into bedrock. The iron superstructure was diagonally braced and the 455-foot length was decked with 5-inch ironbark planking. The handrail was skilfully designed so that it could be let down outside the decking to protect the bridge from debris swept down by floods.<sup>5</sup>

Work was delayed by three floods of over 8 metres and forty lesser floods, but the official opening on 20 August 1874 was 'the greatest gala day' ever witnessed by the Sydney Morning Herald correspondent. In fact, the opening had been pre-empted on 10 July by the need to bury a Wilberforce man at St Matthew's in Windsor while the punt was out of order. However, the procession with two bands across the bridge, the triumphal arch declaring 'WELCOME', the public holiday for everyone in the town and the bullock roasted whole in Thompson Square made Thursday 20 August 1874 'a red-letter day in our history' (Figure 1).<sup>6</sup>

After the opening of the railway to Richmond via Windsor in 1864, Windsor changed from a place where local farmers loaded produce onto boats and ships (for transport to Sydney) to a place to which farmers brought their produce by boat and loaded it onto trains. There was a substantial population in the district by this time and, with ready access to Sydney suppliers, Windsor quickly became the primary commercial and administrative centre in the north-west.

There had been some debate regarding the height of the bridge and the regular flooding of the Hawkesbury River. The Minister for Works, the Honourable John Sutherland, in his speech at the opening, stated:

*the facts connected with its erection, and pointed out why a low-level bridge was erected in place of a high-level structure. While the former cost but £10,000, the latter would have cost upwards of £60,000. In regard to levying of tolls, he promised that there would be no charge made for foot passengers, and that the scale of charges for animals and vehicles would be as low as that of any other bridge in the colony ... and would, he thought, bear favourable comparison with the charges levied on the bridge higher up.*<sup>7</sup>

The materials and design of the bridge were a reflection of government policy. In 1861, the government had decreed that local materials (stone, brick and timber) must be used in preference to wrought iron for public works, as capital expenditure on imported wrought-iron structures represented a significant burden to government budgets. This directive was largely aimed at John Whitton, Engineer-in-Chief for the railways. Nonetheless, Whitton had convinced the government to finance large wrought-iron bridges at Menangle (1863) and Penrith (1867) for the railway lines west and south, for which the combined completed cost was £194,562 – an enormous sum for the colonial government. Consequently, road bridges in NSW, with slower, lighter traffic, were dominated by cheaper construction in timber.

Figure 2. The official opening of Windsor Bridge in 1874. The redundant punt is moored alongside (source: E. and D. Syme, engraving, 'Opening of the New Bridge over the Hawkesbury, Windsor, N.S.W.' State Library of Victoria, reproduced in Windsor Bridge over the Hawkesbury River: preliminary Urban Design and Heritage review of options 1 and 3, RMS, Sydney, August 2011, 19.)

In most circumstances, timber beam bridges offered the cheapest and quickest solution, with simple construction details using local hardwoods. Thousands of these bridges were built, some as independent structures and some as approach spans to major bridges. Where larger spans were needed, laminated timber arches were the usual solution, although these did not have a long service life (a three-span timber laminated arch bridge over South Creek on the eastern side of Windsor only lasted from 1853 to 1881). By the mid-1870s, the PWD engineers were experimenting with timber truss bridges and, by the 1880s, engineers John MacDonald and Percy Allan had developed well engineered timber truss bridges that were economical to erect and maintain, which became the mainstay of bridging in NSW until the 1920s.

The provision of a bridge across the Hawkesbury at Windsor greatly improved the position of those who lived on the farms around Wilberforce and Ebenezer, providing them with ready access to Windsor railway station and its direct links to Parramatta and Sydney. The bridge also joined the Windsor road system to the Putty Road, leading to the Hunter, where many Hawkesbury families had settled since the early nineteenth century and which was developing industrial importance through the coal industry. In contrast, the other road bridge across the Upper Hawkesbury which was opened at North Richmond in 1860, and replaced by the present bridge in 1904, gave access mainly to Kurrajong and Bells Line of Road, which remained primarily a stock route for its first century and more.

The road curving through Thompson Square had a sharp bend onto the new bridge but the exit on the inland side was straight until it turned right into Wilberforce Road.

### 2.1.2 A higher level

A low-level bridge is usually placed at a certain height above normal water level, sufficient that the bridge is available for traffic in times of small floods, yet low enough to be submerged to a sufficient depth to allow drift timber to pass safely over in a major flood. The original Windsor Bridge was placed at 4.3 metres (14.5 feet) high above the tidal level; at Windsor, floods up to 10.8 metres (35 feet) above normal water level are relatively common and the flood of 1867

reached 20.6 metres (67 feet) above normal tide level.<sup>8</sup> Consequently, it was relatively common for the Windsor Bridge to be inundated by the many small floods that affected the Hawkesbury River, as well as the larger ones. By the mid-1890s, with the bridge approaching two decades in service and requiring substantial maintenance, the decision was made to raise the deck level of the bridge, to reduce the number of occasions that it was impassable owing to flooding.

The works to raise the bridge were approved in June 1895 and completed in mid-1897 by Mr James McCall. The construction of the temporary bridge alongside the existing bridge, to carry traffic during works, was commenced on 9 September 1896. The temporary bridge was 460 feet long and was completed and opened for traffic in six weeks. The permanent bridge was raised by 2.5 metres (8 feet), by placing iron cylinders on top of the old ones; all corbels and girders were refitted and those that were unfit to be used again were replaced by new ones. The works also required modifications to the abutments, by inserting concrete 'strips' to stabilise the compacted earth on the new elevated approach alignment. At its new height, the bridge was longer by 6.1 metres (20 feet), with a new timber pier and abutment at the Wilberforce end. A new 10-centimetre (4-inch) tallowwood deck was laid diagonally, with new ironbark kerb logs and new iron handrails.<sup>9</sup> The work was supervised by McCall, who also constructed a temporary bridge alongside it. The approach roads were improved and readjusted and the higher-level bridge was opened in April 1897.<sup>10</sup>

### 2.1.3 New deck; new technology

By the end of World War 1, some two decades after its reconstruction in 1895, the Windsor Bridge was again in need of extensive renovation. Percy Allan, recently appointed as Chief Engineer, National and Local Government Works, determined that the economical solution was to construct a bridge on the existing piers, utilising the relatively new technology of reinforced concrete. A concrete slab and girder bridge was proposed, of similar profile to the existing timber bridge with respect to floodwaters, but which would be more durable.

Reinforced concrete owes its origins to the intuitive work of a number of French and English builders in the mid-nineteenth century, who used iron rods to stiffen monolithic concrete constructions. In the 1850s, Joseph Monier began using wire mesh in concrete to create a better flowerpot and developed the technique to use metal wire grids in concrete for columns and girders. He was granted a patent in 1873 for the construction of bridges and footbridges made of iron-reinforced cement and, in 1875, he built the world's first reinforced concrete bridge – a four-beam footbridge of 13.8 metre span and 4.25 metre width at the Castle of Chazelet in France.

This work was quickly understood to have important implications for the construction industry and, in 1879, German engineer G. A. Wayss purchased Monier's patents and added a scientific dimension to the manufacture of reinforced concrete over the next decade. The engineering contractors Wayss, Freitag and Schuster built the first commercial reinforced concrete bridges in Europe: the Monierbrau footbridge with a 40-metre span in Bremen, Germany; and the

Wildegg. Bridge in Switzerland, spanning 37 metres. It is reported that they had built 320 concrete arch bridges by 1891.<sup>11</sup>

In Australia, W. J. Baltzer, a German engineer in the Sewerage Branch of the NSW PWD, became aware of this emerging technology through his brother in Germany. In 1890, he travelled to Germany to gather information but, on his return, was unsuccessful in piquing the interest of the department. Instead, he joined with several businessmen to form a company, Carter Gummow & Co, to obtain licences from Wayss to use the technology in Australia. Notably, Baltzer translated the existing German manuals on the engineering of reinforced concrete, allowing other engineers to grasp the underlying physics of the material, and the firm was subsequently awarded a contract to construct two sewerage aqueducts at Annandale (Whites Creek Aqueduct and Johnsons Creek Aqueduct, both still in service). Subject to potentially punishing contractual guarantees, the work was completed in 1897 and was universally considered a success. It initiated a long period of experimentation in the use of reinforced concrete for a wide range of applications.

By 1899, the first Monier concrete arch bridges had been built in NSW and Victoria (Monash & Anderson, the engineering consultancy of John Monash in Victoria, purchased the rights to use the Monier patents in Victoria and South Australia), and Monier pipes had been developed to a high degree. A reinforced concrete wall was erected at Parramatta Gaol in 1899 and, from 1902, pre-cast concrete panels on pre-cast concrete trestles were being erected as rat-proof seawalls around the waterfrontages of Sydney. In 1904, a new road bridge across the Hawkesbury River at Richmond was erected which used Monier reinforced concrete arches.

The first concrete beam bridge built in NSW was a small bridge over Muddy Creek on the Princes Highway at Rockdale, constructed in 1907, and other beam bridges were erected over American Creek near Figtree in 1914 and Throsby Creek, Wickham, and Shark Creek, Maclean, in 1916. The oldest extant concrete slab bridges in NSW are over Muttama Creek at Cootamundra (RTA Bridge No. 6438) and Surveyors Creek at Walcha (RTA Bridge No. 3485), both built in 1914.<sup>12</sup>

Concrete slab bridges, in this era, were universally cast in place, with timber formwork erected to form the mould around the concrete. The deck slab and the beams below the deck were formed as a single casting, allowing maximum structural capacity to be achieved in a single stage of work. For the Windsor Bridge, however, a new, unique approach was adopted. One criterion for the upgrade of the Windsor Bridge was that it must remain open to traffic throughout the replacement process. In 1895, this was achieved by the use of a temporary bridge but, for unknown reasons, a temporary bridge was not erected in 1920. Instead, the existing bridge was upgraded in two longitudinal half sections, with half the bridge remaining open while the other half was reconstructed. The logistics of this requirement meant that formwork construction was constrained and, for this reason, the concrete structural beams were individually cast in moulds on the riverbank adjacent to the bridge and lifted into place by crane when ready. The deck was then cast in place as a flat slab lying on the beams between piers.

The construction of the reinforced concrete elements of the Windsor Bridge was undertaken by the State Monier Pipe and Reinforced Concrete Works, a state government enterprise formed in 1915 when the NSW Government purchased the operations and intellectual property of Carter Gummow & Co. The bridge extended to 144 metres (468 feet) in length, with an additional (reinforced concrete) pier at the Wilberforce end, and 6.2 metres (20 feet) between kerbs. Its final height was 6.8 metres (22 feet) above normal river level (Figure 7).

005_WINDSOR_BRIDGE_DEMOLITION_2020	SW	Former Windsor Bridge spans.	
006_WINDSOR_BRIDGE_DEMOLITION_2020	SW	Overview of a span.	
007_WINDSOR_BRIDGE_DEMOLITION_2020	SW	Overview of a span.	
008_WINDSOR_BRIDGE_DEMOLITION_2020	SW	Overview of a span.	
009_WINDSOR_BRIDGE_DEMOLITION_2020	SW	Southern abutment.	
010_WINDSOR_BRIDGE_DEMOLITION_2020	W	Approach to the southern abutment.	
011_WINDSOR_BRIDGE_DEMOLITION_2020	W	Approach to the northern abutment, including new footpath.	

Image name	Direction	Details	Thumbnail
012_WINDSOR_BRIDGE_DEMOLITION_2020	SW	Overview of former Windsor Bridge and northern abutment.	
013_WINDSOR_BRIDGE_DEMOLITION_2020	SW	Overview of former Windsor Bridge and the southern abutment.	
014_WINDSOR_BRIDGE_DEMOLITION_2020	SW	Overview of span, showing air bags.	
015_WINDSOR_BRIDGE_DEMOLITION_2020	SW	Overview of span, showing air bags.	
016_WINDSOR_BRIDGE_DEMOLITION_2020	W	Overview of span, showing air bags.	
017_WINDSOR_BRIDGE_DEMOLITION_2020	W	Overview of the northern abutment showing demolition yard.	
018_WINDSOR_BRIDGE_DEMOLITION_2020	W	Reinforced concrete wingwalls and northern abutment span.	

Image name	Direction	Details	Thumbnail
019_WINDSOR_BRIDGE_DEMOLITION_2020	SW	Concrete saw cutting through a span deck.	
020_WINDSOR_BRIDGE_DEMOLITION_2020	SW	Concrete saw cutting through a span deck.	
021_WINDSOR_BRIDGE_DEMOLITION_2020	SW	Overview of pontoon-mounted hydraulic lift showing generator and scaffolding.	
022_WINDSOR_BRIDGE_DEMOLITION_2020	SW	Walkway girder and chain link fence extant between removed section of span.	
023_WINDSOR_BRIDGE_DEMOLITION_2020	SW	Walkway girder and chain link fence.	
024_WINDSOR_BRIDGE_DEMOLITION_2020	SW	Southern abutment showing reinforced concrete wingwall.	
025_WINDSOR_BRIDGE_DEMOLITION_2020	NB	Overview of span showing air bags on the deck.	

Image name	Direction	Details	Thumbnail
026_WINDSOR_BRIDGE_DEMOLITION_2020	NW	Overview of span showing air bags on the deck.	
027_WINDSOR_BRIDGE_DEMOLITION_2020	NW	Northern abutment.	
028_WINDSOR_BRIDGE_DEMOLITION_2020	SW	Deck cutting in progress. The deck is supported by a hydraulic lift.	
029_WINDSOR_BRIDGE_DEMOLITION_2020	W	Road saw blades and equipment.	
030_WINDSOR_BRIDGE_DEMOLITION_2020	SW	Deck cutting using an oxyacetylene torch. The deck is supported by a hydraulic lift.	
031_WINDSOR_BRIDGE_DEMOLITION_2020	SW	Detail of the road saw.	
032_WINDSOR_BRIDGE_DEMOLITION_2020	S	Southern abutment.	

Image name	Direction	Details	Thumbnail
033_WINDSOR_BRIDGE_DEMOLITION_2020	S	Condition of the southern approach.	
034_WINDSOR_BRIDGE_DEMOLITION_2020	S	Condition of the southern approach.	
035_WINDSOR_BRIDGE_DEMOLITION_2020	SW	Overview of the southern abutment and access from The Terrace.	
036_WINDSOR_BRIDGE_DEMOLITION_2020	SW	Overview of a southern span.	
037_WINDSOR_BRIDGE_DEMOLITION_2020	SW	A removed deck span, cut by road saw and oxyacetylene torch.	
038_WINDSOR_BRIDGE_DEMOLITION_2020	SW	Detail of exposed deck.	
039_WINDSOR_BRIDGE_DEMOLITION_2020	SW	Detail of walkway girder and chain link fence.	

Image name	Direction	Details	Thumbnail
040_WINDSOR_BRIDGE_DEMOLITION_2020	NW	Detail of walkway girder and chain link fence.	
041_WINDSOR_BRIDGE_DEMOLITION_2020	NW	Detail of walkway girder and crosshead connection point.	
042_WINDSOR_BRIDGE_DEMOLITION_2020	NW	Detail of iron piers and reinforced concrete crosshead.	
043_WINDSOR_BRIDGE_DEMOLITION_2020	NW	Overview of pontoon-mounted hydraulic lift.	
044_WINDSOR_BRIDGE_DEMOLITION_2020	NW	Overview of Windsor Bridge and pontoon.	
045_WINDSOR_BRIDGE_DEMOLITION_2020	NW	Exposed southern abutment concrete wingwalls.	
046_WINDSOR_BRIDGE_DEMOLITION_2020	NW	Southern-most spans showing the condition of the piers and decking.	

Image name	Direction	Details	Thumbnail
047_WINDSOR_BRIDGE_DEMOLITION_2020	NW	Overview of Windsor Bridge during removal.	
048_WINDSOR_BRIDGE_DEMOLITION_2020	NW	Overview of Windsor Bridge during removal.	
049_WINDSOR_BRIDGE_DEMOLITION_2020	N	Condition of the deck during removal.	
050_WINDSOR_BRIDGE_DEMOLITION_2020	N	New Windsor Bridge on the right, former Windsor Bridge on the left.	
051_WINDSOR_BRIDGE_DEMOLITION_2020	N	New Windsor Bridge on the right, former Windsor Bridge on the left.	
052_WINDSOR_BRIDGE_DEMOLITION_2020	N	Overview of the southern abutment and approach.	
053_WINDSOR_BRIDGE_DEMOLITION_2020	N	Condition of the decking during removal.	

Image name	Direction	Details	Thumbnail
054_WINDSOR_BRIDGE_DEMOLITION_2020	N	Condition of the decking during removal.	
055_WINDSOR_BRIDGE_DEMOLITION_2020	NW	Overview of the former Windsor bridge.	
056_WINDSOR_BRIDGE_DEMOLITION_2020	NW	Southern-most spans.	
057_WINDSOR_BRIDGE_DEMOLITION_2020	NW	Overview of the removal from the southern embankment.	
058_WINDSOR_BRIDGE_DEMOLITION_2020	NW	Removed span of deck.	
059_WINDSOR_BRIDGE_DEMOLITION_2020	NW	Cutting of the deck kerb using powered hand saw.	
060_WINDSOR_BRIDGE_DEMOLITION_2020	NW	Cutting of the deck kerb using powered hand saw.	

Image name	Direction	Details	Thumbnail
061_WINDSOR_BRIDGE_DEMOLITION_2020	NW	Removed span of deck.	
062_WINDSOR_BRIDGE_DEMOLITION_2020	NW	Pontoon-mounted hydraulic lift.	
063_WINDSOR_BRIDGE_DEMOLITION_2020	NW	Pontoon-mounted hydraulic lift.	
064_WINDSOR_BRIDGE_DEMOLITION_2020	SW	Overview of pontoon-mounted hydraulic lift and bridge.	
065_WINDSOR_BRIDGE_DEMOLITION_2020	SW	Preparation of the deck for arranging air bags.	
066_WINDSOR_BRIDGE_DEMOLITION_2020	SE	Condition of the former Windsor bridge deck during Removal.	
067_WINDSOR_BRIDGE_DEMOLITION_2020	S	Condition of the deck showing temporary scaffolding on the western elevation.	

Image name	Direction	Details	Thumbnail
068_WINDSOR_BRIDGE_DEMOLITION_2020	SE	Condition of the deck during removal.	
069_WINDSOR_BRIDGE_DEMOLITION_2020	SE	Detail of air bags used for rolling deck spans.	
070_WINDSOR_BRIDGE_DEMOLITION_2020	SE	Detail of air bag used for rolling deck spans.	
071_WINDSOR_BRIDGE_DEMOLITION_2020	SE	Detail of valve and material.	
072_WINDSOR_BRIDGE_DEMOLITION_2020	S	Condition of the deck showing temporary scaffolding on the western elevation.	
073_WINDSOR_BRIDGE_DEMOLITION_2020	S	Detail of temporary scaffolding.	
074_WINDSOR_BRIDGE_DEMOLITION_2020	SE	Detail of powered boats used to manoeuvre the pontoon.	

Image name	Direction	Details	Thumbnail
075_WINDSOR_BRIDGE_DEMOLITION_2020	SW	Detail of cut through the deck kerbing.	
076_WINDSOR_BRIDGE_DEMOLITION_2020	S	Detail of deck span to be removed.	
077_WINDSOR_BRIDGE_DEMOLITION_2020	SE	Detail of deck span to be removed.	
078_WINDSOR_BRIDGE_DEMOLITION_2020	SE	Detail of kerbing and temporary covers.	
079_WINDSOR_BRIDGE_DEMOLITION_2020	SE	Detail of tools and air hoses.	
080_WINDSOR_BRIDGE_DEMOLITION_2020	SE	Exposed span showing reinforced concrete deck.	
081_WINDSOR_BRIDGE_DEMOLITION_2020	NW	Steel cable hopped with clasps.	

Image name	Direction	Details	Thumbnail
082_WINDSOR_BRIDGE_DEMOLITION_2020	SE	Overview of the deck.	
083_WINDSOR_BRIDGE_DEMOLITION_2020	NE	Reinforcement and other metal stripped from the deck.	
084_WINDSOR_BRIDGE_DEMOLITION_2020	NW	Northern abutment.	
085_WINDSOR_BRIDGE_DEMOLITION_2020	SW	Northern abutment showing preparation of the deck for span removal.	
086_WINDSOR_BRIDGE_DEMOLITION_2020	SW	Preparation of the deck span for lifting.	
087_WINDSOR_BRIDGE_DEMOLITION_2020	S	Positioning of the pontoon-mounted hydraulic lift.	
088_WINDSOR_BRIDGE_DEMOLITION_2020	S	Overview of the lifting operation, showing the deck span lifted above the bridge.	

Image name	Direction	Details	Thumbnail
089_WINDSOR_BRIDGE_DEMOLITION_2020	SW	Windsor Bridge showing the deck span lifted above the bridge.	
090_WINDSOR_BRIDGE_DEMOLITION_2020	SW	Overview of the bridge.	
091_WINDSOR_BRIDGE_DEMOLITION_2020	SW	Overview of the bridge showing the air bags being prepared for rolling.	
092_WINDSOR_BRIDGE_DEMOLITION_2020	SW	Overview of the bridge showing the air bags being prepared for rolling.	
093_WINDSOR_BRIDGE_DEMOLITION_2020	SW	Air bags connected to air hose.	
094_WINDSOR_BRIDGE_DEMOLITION_2020	SW	Detail of span removed from the deck.	
095_WINDSOR_BRIDGE_DEMOLITION_2020	SW	Detail of the pontoon-mounted hydraulic lift raising the span above the bridge.	

Image name	Direction	Details	Thumbnail
096_WINDSOR_BRIDGE_DEMOLITION_2020	SW	Detail of the pontoon-mounted hydraulic lift raising the span above the bridge.	
097_WINDSOR_BRIDGE_DEMOLITION_2020	SW	Forklift manoeuvring air bags into position. Air bags have been skewed to allow for eastward drag.	
098_WINDSOR_BRIDGE_DEMOLITION_2020	SW	Forklift manoeuvring air bags into position. Air bags skewed to allow for eastward drag.	
099_WINDSOR_BRIDGE_DEMOLITION_2020	W	Overview of air bags.	
100_WINDSOR_BRIDGE_DEMOLITION_2020	NW	Overview of demolition yard prepared for deck span removal.	
101_WINDSOR_BRIDGE_DEMOLITION_2020	SW	Additional cutting of impeding section of deck with oxyacetylene torch.	
102_WINDSOR_BRIDGE_DEMOLITION_2020	SW	Additional cutting of impeding section of deck with oxyacetylene torch.

Comments:	Condition of an iron pier, as removed from the river-bed

Image name	Direction	Details	Thumbnail
452_WINDSOR _BRIDGE_DEM OLITION_2021	S	Detail of the head of an iron pier. The pier is infilled with large aggregate concrete.	
453_WINDSOR _BRIDGE_DEM OLITION_2021	W	Detail of the pier head showing the flange and ribbing.	
454_WINDSOR _BRIDGE_DEM OLITION_2021	W	Detail of the flange and ribbing showing the condition to be poor.	
455_WINDSOR _BRIDGE_DEM OLITION_2021	W	Condition of the rim.	

Image name	Direction	Details	Thumbnail
456_WINDSOR _BRIDGE_DEM OLITION_2021	SW	Pier rim showing bolt holes used to connect to the headstock.	
457_WINDSOR _BRIDGE_DEM OLITION_2021	SW	Condition of bolt holes.	
458_WINDSOR _BRIDGE_DEM OLITION_2021	S	Detail of concrete inside the pier, showing modern sharp angled aggregate associated with the headstocks.	
459_WINDSOR _BRIDGE_DEM OLITION_2021	S	Detail of concrete inside the pier, showing modern sharp angled aggregate associated with the headstocks.	
460_WINDSOR _BRIDGE_DEM OLITION_2021	S	Detail of bolt still attached through the pier rim.	
461_WINDSOR _BRIDGE_DEM OLITION_2021	W	Base of the pile, showing internal ribbing and flanges.	

Image name	Direction	Details	Thumbnail
462_WINDSOR_BRIDGE_DEMOLITION_2021	NE	Interior of the pier, showing older river pebble aggregate, associated with the construction of the piers.	
463_WINDSOR_BRIDGE_DEMOLITION_2021	NE	Detail of bolts in the flange. The break in the pier shows oxidation through the iron.	
464_WINDSOR_BRIDGE_DEMOLITION_2021	NE	Break in the pier showing oxidation through the iron.	
465_WINDSOR_BRIDGE_DEMOLITION_2021	NE	Aggregate shown to be large river stones.	
466_WINDSOR_BRIDGE_DEMOLITION_2021	NE	Overview of the bottom of the pier.	
467_WINDSOR_BRIDGE_DEMOLITION_2021	NE	Condition of the pier as removed from the water.	

Image name	Direction	Details	Thumbnail
468_WINDSOR_BRIDGE_DEMOLITION_2021	NE	Condition of the pier showing an accretion on the exterior. The accretion may be one of several substances, including natural oxidation mixed with algae or hydraulic cement render.	
469_WINDSOR_BRIDGE_DEMOLITION_2021	NE	Coating shown to extend partway up the pier.	
470_WINDSOR_BRIDGE_DEMOLITION_2021	NE	Condition of pier.	
471_WINDSOR_BRIDGE_DEMOLITION_2021	NE	Detail of oxidation through the pier, showing it to be extensive.	
472_WINDSOR_BRIDGE_DEMOLITION_2021	E	Overview of oxidation.	
473_WINDSOR_BRIDGE_DEMOLITION_2021	E	Detail of coating, showing it to have been partially removed when extracted from the riverbed.	

Image name	Direction	Details	Thumbnail
474_WINDSOR _BRIDGE_DEM OLITION_2021	E	Underside of the coating shown to be moist.	
475_WINDSOR _BRIDGE_DEM OLITION_2021	E	Pier seam shown to be covered by the coating.	
476_WINDSOR _BRIDGE_DEM OLITION_2021	NW	Overview of the pier.	
477_WINDSOR _BRIDGE_DEM OLITION_2021	NW	Overview of the pier.	
478_WINDSOR _BRIDGE_DEM OLITION_2021	NW	Scale of pier shown at human height.
