1. INTRODUCTION

Ramboll Australia Pty Ltd (Ramboll) was engaged by Transport for New South Wales (TfNSW) to complete periodic surface water monitoring upstream and downstream of contamination identified with the Goulburn – Bombala rail corridor at Tarago, New South Wales (NSW).

Contamination has been identified along approximately 900 lineal meters of the rail corridor (Ramboll, 2019). This area is herein referred to as "the Site" and is presented with surface water monitoring locations on **Figure 2-1**.

1.1 Background

The Woodlawn Mines Ore Concentrate Load-Out Complex operated within the Goulburn – Bombala rail corridor at Tarago from the 1970s to the 1990s. Concentrates were produced at the Woodlawn Mine approximately 6.5 km west and included a zinc concentrate consisting mainly of sphalerite (zinc oxide), lead concentrate of galena (lead sulphide) and copper concentrate of chalcopyrite (copper iron sulphide).

On 25 March 2020, the NSW Environment Protection Authority (NSW EPA) declared the Site as significantly contaminated under Section 11 of the *Contaminated Land Management Act* 1997 (Declaration Number 20201103). TfNSW is currently managing the contamination under a Voluntary Management Proposal (VMP) which includes further assessment of site contamination and remediation to address the potential risks to human health and the environment.

An extensive body of work has been completed to characterise contaminant impacts associated with historical operation of the Site. This work has included assessment of soil, groundwater and surface water across the Site and assessment of soil, groundwater, surface water and airborne dust within the surrounding area. A previous assessment completed by Ramboll (2020) identified contaminants of potential concern (CoPC) relevant to receiving surface waters were limited to metals which exceed relevant human health and ecological assessment criteria.

In 2020, Environmental Risk Sciences Pty Ltd (EnRiskS) were commissioned to undertake a review of the existing data and provide further advice in relation to the risk to human health and the environment due to lead and other metals in areas adjacent to the Site (EnRiskS, 2020). As part of the assessment EnRiskS (2020) developed site specific criteria for metals in soil, sediment, and surface water for the drainage features accessed during surface water monitoring. These site-specific criteria have been adopted for assessment of the surface water results presented in this report.

Periodic monitoring of onsite and offsite surface water commenced in 2019 and ceased in April 2021 following consistent observation that risks to the receiving environment from Site contamination were low. On 6 September 2022 the NSW EPA issued a Prevention Notice to TfNSW relating to deficiencies in the implementation the Tarago Lead Management Plan (Ramboll, 2019). In response, surface water monitoring was reinstated to further assess temporal and geographic trends in contaminant distribution from the Site.

1.2 Objectives

The objectives of the surface water monitoring program are to:

- Collect reliable water quality data, to provide a data continuum which forms the basis for assessment of impacts from the Site on surrounding surface water receptors.
- Present data to date on a quarterly basis.

2. SCOPE OF WORK

2.1 Monitoring Scope

The scope of work for each surface water monitoring event includes:

- Collection of surface water samples at 11 predefined locations, as presented in **Table 2-1** and **Figure 2-1** (plus collection of quality assurance samples).
- Measurement of surface water physico-chemical properties including pH, temperature, electrical conductivity (EC), dissolved oxygen (DO), redox potential (ORP) and total dissolved solids (TDS).
- Submission of samples to a National Association of Testing Authorities (NATA) accredited laboratory for analysis of total and dissolved metals (aluminium, arsenic, barium, beryllium, cadmium, chromium, cobalt, iron, lead, manganese, mercury, nickel and zinc).
- Assessment of laboratory results against adopted assessment criteria, as presented in **Section 5**.
- · Assessment of data quality and reliability.

Table 2-1: Surface Water Sampling Locations

Sample ID	Location
On and Near Site	
SW1	Adjacent to a culvert on the western side of the rail line at CH 262.600 on tributary of Mulwaree River.
SW1 - UP	Intended as an up-gradient sample, located on a western tributary of the Mulwaree River, approximately 100 m west of the rail corridor at CH. 262.600.
SW2	Adjacent to a culvert on the eastern side of the rail line at CH 262.600 on tributary of Mulwaree River.
SW3	Adjacent to a culvert on the western side of the rail line at CH 262.300.
SW4	Adjacent to a culvert on the eastern side of the rail line at CH 262.300.
SW5	Adjacent to a culvert on the western side of the rail line at CH 262.000.
SW6	Adjacent to a culvert on the eastern side of the rail line at CH 262.000.
SW7	A dam located downgradient from the Site northern rail culvert forming part Lot A DP 440822.
Offsite – Mulwaree River	
SW8	Mulwaree River adjacent Lumley Road.
SW9	Mulwaree River off Braidwood Road.
SW10	Mulwaree River off Braidwood Road.

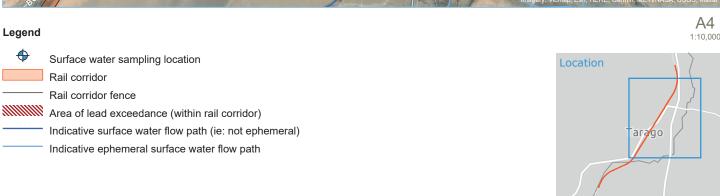

Figure 2-1: Surface Water Monitoring Locations

3. SAMPLING AND ANALYSIS QUALITY PLAN

Prior to the commencement of routine surface water monitoring, which commenced in February 2020, Ramboll prepared a Sampling and Analysis Quality Plan titled 'Sampling Analysis and Quality Plan (SAQP) – Surface Water Monitoring, Tarago Lead Management' (Ramboll, 2020).

The SAQP is attached as **Appendix 1**.

4. QUALITY ASSURANCE / QUALITY CONTROL PROGRAM

4.1 QA/QC Data Evaluation

An assessment was made of data completeness, comparability, representativeness, precision and accuracy based on field and laboratory considerations, as outlined in NEPM 1999 Amendment (2013) guidelines. The DQI assessment for the September 2022 surface water monitoring event is provided in **Table 4-1**.

Table 4-1: QA/QC -Assessment of DQIs

Assessment of DQIs (as per NSW EPA, 2020)	Completeness	Comparability	Representativeness	Precision	Accuracy	
Field QA/QC						
Sampling team	Sampling was completed by Ramboll experienced environmental scientists/engineers between 12 and 13 September 2022.	x	х			
Reference to sampling plan/method, including any deviations from SAQP	Sampling was undertaken in general accordance with the SAQP. SW5 could not be sampled as the location was dry.	x				
Any information that could be required to evaluate measurement uncertainty for subsequent testing (analysis)	Samples were collected from 11 pre-determined locations (unless dry) for consistency between the sampling rounds. Samples were collected from 100 mm below surface, where practical.				x	x
Decontamination procedures carried out between sampling events	Samples were collected directly into laboratory supplied sampling containers using dedicated disposable sampling equipment. Disposable nitrile gloves were worn during sample collection and were changed between sample locations. Field parameters were recorded after analytical samples had been collected. Non disposable sampling equipment (i.e., water quality meter probe) were rinsed between sampling locations with a solution of Decon®90 and potable water.			x	x	x
Logs for each sample collected, including date, time, location (with GPS coordinates if possible), sampler, duplicate samples, chemical analyses to be performed, site observations and weather/environmental (i.e., surroundings) conditions. Include any diagrams, maps, photos.	Each sample was labelled with a unique sample ID, as presented in Table 2-1 . Surface water parameters including pH, temperature, EC, DO and ORP were measured and recorded for each of the sampling locations using a calibrated multiparameter water quality meter. Measurements of field parameters were recorded once parameters had stabilised.		x	x		
Chain of custody fully identifying – for each sample – the sampler, nature of the sample, collection date, analyses to be performed, sample preservation method, departure time from the site and dispatch courier(s) (where applicable)	Samples were transported to the laboratory under chain of custody conditions. The chain of custody forms were signed by the laboratory on receipt of the samples. All surface water samples were placed into laboratory-supplied bottles that were prepared with the required preservatives. Surface water samples were stored in an ice filled cooler in the field and during transportation to the laboratory.	x	x			
Field quality assurance/quality control results (e.g., field blank, rinsate blank, trip blank, laboratory prepared trip spike)	Intra-laboratory and inter-laboratory duplicate results, are presented in Table 13 , Appendix 3 . No trip spike/blanks were collected due to the targeted contaminants of the investigation not being volatile. Relative Percent Differences (RPDs) were all below the RPD criteria (<=30%).				x	x

Assessment of DQIs (as per NSW EPA, 2020)	Completeness	Comparability	Representativeness	Precision	Accuracy	
Sample splitting techniques – subsampling, containers/preservation (ensure unique ID for subsequent samples provided)	The external duplicate samples were obtained by first gathering a larger volume of water and then decanting to create three identical sub samples. Field duplicate samples were labelled with a unique identification that does not reveal the association between the primary and duplicate samples e.g., D01.			x		
Statement of duplicate frequency Field instrument calibrations (when used)	Intra- and inter- laboratory duplicate samples were analysed at a rate of 9%. The water quality meter was hired from a rental company who calibrated the equipment prior to hire. The calibration certificate is included in			х	x	x
Sampling devices and equipment	Appendix 2. A water quality meter was used to collect field data, including pH, temperature, EC, DO, ORP and		x			
Laboratory QA/QC						
A copy of signed chain-of-custody forms acknowledging receipt date, time and temperature and identity of samples included in shipments	Copy of the signed COC forms are provided in Appendix 4.	x	x			
Record of holding times and a comparison with method specifications	Review of the Chain of Custody (COC) forms and laboratory certificates indicated that holding times were met.	x	х			
Analytical methods used, including any deviations	Summary analytical methods were included in the laboratory test certificates presented in Appendix 4 .	x	x			
Laboratory accreditation for analytical methods used, also noting any methods used which are not covered by accreditation	Eurofins MGT was used as the primary laboratory and ALS was used as the secondary laboratory. The laboratory certificates are NATA stamped.	x			x	
Laboratory performance for the analytical method using interlaboratory duplicates	Analytical methods were comparable between laboratories.		х			х
Surrogates and spikes used throughout the full method process, or only in parts. Results are corrected for the recovery	A matrix spike recovery less than the lower data quality objective was reported by the secondary laboratory (ALS) for mercury. All remaining laboratory control samples and surrogates were acceptable.	x	x			
A list of what spikes and surrogates were run with their recoveries and acceptance criteria (tabulate)	Laboratory spike and surrogate recoveries are detailed in the laboratory certificates provided in Appendix 4.		x			х
Practical quantification limits (PQL)	The PQL for dissolved mercury (<0.0001 mg/L) exceeds the adopted ecological screening criteria for 95% species protection (0.00006 mg/L). Mercury was not detected above the PQL in any or the samples collected indicating that any exceedances of the criteria are anticipated to be minor (within 0.00004 mg/L). All remaining PQLs were below the adopted assessment criteria.		x			

Assessment of DQIs (as per NSW EPA, 2020)	Ramboll's Assessment	Completeness	Comparability	Representativeness	Precision	Accuracy
Reference laboratory control sample (LCS) and check results	The results for laboratory control samples were acceptable and no detections were made in blank samples.	x				
Laboratory frequencies (tabulate)	Laboratory quality control samples including duplicates, surrogate spikes and blanks were undertaken by the laboratories at appropriate frequencies.	x				x
Laboratory results (tabulate)	The results for laboratory duplicates were acceptable and no detections were made in blank samples.	x				x

Overall, it is considered that the completed investigation works and the data obtained adequately complied with the requirements of NEPM 1999 Amendment (2013) guidelines. Some uncertainty surrounds the mercury results due to the low matrix spike recoveries and PQLs above criteria. However, it is considered that the data is of suitable quality to meet the project objectives.

5. ASSESSMENT CRITERIA

The criteria adopted for the assessment of surface water contamination are sourced from the following references:

- National Environment Protection Council (NEPC), National Environment Protection (Assessment of Site Contamination) Measure (NEPM) 1999, as amended 2013 (NEPC, 2013).
- National Health and Medical Research Council (NHMRC) (2001) *National Resource Management Ministerial Council (NRMMC) Australian Drinking Water Guidelines 6, Version*3.6 updated March 2021, (ADWG, 2011).
- National Health and Medical Research Council (NHMRC), National Resource Management Ministerial Council (NRMMC) Guidelines for Managing Risks in Recreational Water (NHMRC, 2008).
- Department of Environment and Conservation (DEC) *Guidelines for the Assessment and Management of Groundwater Contamination* (DEC, 2007).
- Australian and New Zealand Guidelines for Fresh and Marine Water Quality (ANZG, 2018) (available at www.waterquality.gov.au/anz-quidelines).
- Australian and New Zealand Environment and Conservation Council (ANZECC) &
 Agriculture and Resource Management Council of Australia and New Zealand (ARMCANZ)
 Australian and New Zealand Guidelines for Fresh and Marine Water Quality (ANZECC,
 2000).
- Advice on risks to human health and the environment: Boyd Street and publicly accessible areas, Tarago NSW, Site specific criteria Protection of human health and terrestrial and/or aquatic ecosystems (EnRiskS, 2020).

5.1 Rationale for Application of Guidelines

The relevance of guidelines was determined based on iterative screening from the broadest and most sensitive water usage scenario which occurs in the Mulwaree River back through agricultural land and public roads to the least sensitive scenario which occurs at the Site.

All results from Mulwaree River samples (SW8 to SW10) have been screened against Tier 1 / screening guidelines relevant to human health (incidental ingestion), freshwater ecology, irrigation and stock watering as each of these receptors occur within the receiving waters (the Mulwaree River). Should results exceed screening guidelines and indicate site contamination as the source, it would be appropriate to apply the guidelines that were exceeded to sampling locations upstream as this would inform further assessment of the Site as the potential source. Previous monitoring results do not indicate site contamination is adversely affecting the Mulwaree River. Site-specific guidelines were developed for Arsenic, Cadmium, Lead, Manganese and Nickel (EnRiskS, 2020) that integrate the ephemeral nature of surface water features between the Mulwaree River and the Site. Additionally, several technical refinements were identified and are relevant to guideline application. These were:

- ADWG (2011) Section 6.3.1 states that guideline values refer to the total amount of the substance present, regardless of its form (e.g., in solution or attached to suspended matter) and so analytical results from unfiltered samples should be assessed against human health criteria. The primary human health risk from contaminants in surface water from the Site is via recreational use. NHMRC (2008) suggests that 10-times the ADWG values may provide a conservative estimate of acceptable recreational exposure guidelines values. This approach was applied to derive recreational exposure criteria.
- ANZG (2018) guidelines for metals in freshwater are adopted from the Australian and New Zealand Guidelines for Fresh and Marine Water Quality (ANZECC, 2000) which states the major toxic effect of metals comes from the dissolved fraction, so it is valid to filter

- samples (e.g., to 0.45 μ m) and compare the filtered concentration against the trigger values.
- Water hardness is identified as a physical parameter with quantifiable effects. Correction factors are defined in the guidelines to address the effect of water hardness on the bioavailability of cadmium, chromium, lead, nickel and zinc.

To define appropriate hardness correction factors, water was conservatively presumed to be moderately hard based on the Goulburn Mulwaree Regional State of the Environment Report 2004-2009 (Goulburn Mulwaree Council, 2009). Hardness correction factors were adopted from Table 3.4.4 of the *Australian and New Zealand Guidelines for Fresh and Marine Water Quality* (ANZECC, 2000) to refine Tier 1 criteria as described in **Table 5-1** below.

Table 5-1: Hardness Corrections for Tier 1 Freshwater Ecology Guidelines

	Original guideline value (mg/L)				
Cadmium	0.0002	2.7	0.00054		
Chromium	0.001	2.5	0.0025		
Lead	0.0034	4	0.0136		
Nickel	0.011	2.5	0.0275		
Zinc	0.008	2.5	0.02		

Application of guidelines at each sampling point is summarised in **Table 5-2**.

Table 5-2: Guidelines Applied to Sampling Points

NA – not applicable

blank cell denoted with - indicates no criterion available.

^a Aluminium guidelines for pH > 6.5, based on the pH of groundwater measured at the Site and surrounding area. This is an aesthetic criteria only based on post flocculation problems

^b Guideline value for arsenic (III).

^c Guideline value for chromium (VI).

^d Guideline value for inorganic mercury.

 $^{^{\}rm e}$ 99% species protection level DGV has been adopted to account for the bioaccumulating nature of this contaminant.

^f Guideline value for m-xylene. Guideline values also exist for both o-xylene and p-xylene as per ANZG (2018). The default guideline value for m-xylene guideline has been adopted as it is the most conservative

 $^{^{\}it g}$ Hardness correction factor applied to the threshold value as detailed in ANZG 2018

^h Calculated using the ADWG (2011) aesthetic guideline. Insufficient data to set a guideline value based on health considerations

6. RESULTS

6.1.1 Monitoring Events

A total of 10 monitoring events have been completed between August 2019 and September 2022. Surface water monitoring events were completed after a period of rainfall (where possible) as this is the only occasion where surface water is present in the drainage channels.

Table 6-1 includes information on rainfall conditions preceding each monitoring event. The table includes comparison of the rainfall over the 48-hour period preceding the sampling event to the design rainfall events for the Mulwaree catchment (Wollondilly and Mulwaree Rivers Flood Study WMA Water 2016) in order to provide an indication of the significance of the rainfall event. Average monthly rainfall data compared to actual monthly rainfall data is also included to indicate the general climate conditions in the month of sampling.

Table 6-1: Indicative Summary of Rainfall Preceding Sampling Events

	Max Rainfall		Rainfall in 48 hrs preceding monitoring events (mm)										
Event	over 48hr Critical Duration (mm)	13-Aug-19	24-Sep-19	29-Jan-20	1-Apr-20	11-Aug-20	13-Oct-20	28-Jan-21	14-Apr-21	13-Jul-21	12-Sep-22

Monthly Rainfall	Observed (mm)	19	41.2	22	79.2*	157.8	94.4	64	2.4	26	66.6		
Average Monthly	Rainfall (mm)	42.9	44	49	40.4*	42.9	44	63.9	25.9	32.6	44.1		
Comment		Dry month, dry conditions precedent	Average rainfall month, dry conditions precedent	Dry month, dry conditions precedent	Wet month, dry conditions precedent	Wet month, high rainfall event precedent	Wet month, dry conditions precedent	Average rainfall month, dry conditions precedent	Dry month, dry conditions precedent	Average rainfall moth, dry conditions precedent	Wet month, low rainfall event precedent		

Notes: All rainfall data was sourced from the Australian Bureau of Meteorology. Daily rainfall was sourced from the closest weather station with rainfall records preceding each monitoring event (Lake Bathurst, Windellama and Goulburn Airport). Monthly averages and records were sourced from the closest weather station with a complete record (Goulburn Airport).

^{*}Monthly observations and averages are for rainfall in the calendar month in which each monitoring event occurred except for the 1 April 2020 event for which March data is presented. Based on this the monthly data is not a direct representation of rainfall preceding monitoring though is considered as an indicator of general conditions around each monitoring event.

AEP - Annual Exceedance Probability

6.1.2 Physico-Chemical Results

Surface water physico-chemical parameters were measured in the field during the majority of sampling rounds and are summarised in **Table 6-2**. The full physico-chemical parameter dataset is provided as **Table 1** of **Appendix 3**.

Table 6-2: Summary of Surface Water Physico-Chemical Parameters

Sample			Temp.	SPC	рН	DO	ORP	TDS

6.1.3 Analytical Results

A summary of the surface water analytical results for monitoring events from August 2019 to September 2022 is presented in **Table 6-3** and **Table 6-4** for on and near site and the Mulwaree River sampling locations, respectively. The corresponding results tables are presented in **Tables 2** through **12** of **Appendix 3**.

SW7 is sampled from a dam receiving water from the Northern Culvert and is located at 2135 Braidwood Road. Based on repeated discussion with the owner of 2135 Braidwood Road Ramboll understands the dam is to be decommissioned and backfilled in the near future. Within this context elevated contaminant concentrations in surface water identified at this location are not considered to present a risk to human health or ecology.

Table 6-3: Summary of Onsite and Near Site Surface Water Analytical Results (SW1_UP, SW1, SW2, SW3, SW4, SW5, SW6, SW7)

6.1.4 Analytical Results Trends

The following time series charts present total and dissolved concentrations of lead, copper and zinc for the 10 monitoring events completed between August 2019 and September 2022. Dailly rainfall is presented for the same period.

6.1.4.1 Lead

Concentration Trends On and Near Site

Figure 6-1 presents total lead concentrations reported in surface water samples (SW1-UP, SW1 through to SW7) collected upstream and downstream of three onsite rail culverts. The data are shown relative to the adopted site-specific criterion for human health (7 mg/L), derived by EnRiskS (2020). The y-axis is presented on a logarithmic scale to allow for presentation of the relative variation in concentrations.

All surface water samples collected on and near the site to date have reported total lead concentrations below the site-specific human health criterion. Slight increases in concentrations were reported at SW1, SW3 and SW4 (maximum increase of 0.019 mg/L at SW4) when compared to the previous monitoring event (July 2021).

Figure 6-2 presents dissolved lead concentrations reported for the samples mentioned above. Data is presented relative to the EnRiskS (2020) site-specific ecological criterion for lead (0.1 mg/L). All samples to date have reported dissolved lead concentrations below the site-specific ecological criterion. Similar to total lead, slight increases in concentrations were reported at SW3 and SW4 (maximum increase of 0.009 mg/L at SW3 and SW4, respectively) when compared to the previous monitoring event (July 2021).

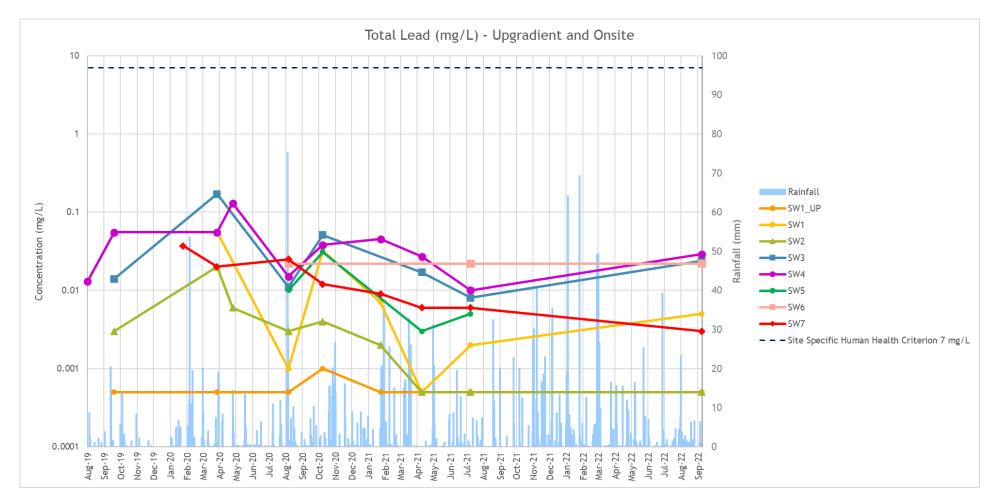

Figure 6-1: Upgradient and Onsite Total Lead Concentration Trend - Logarithmic Scale

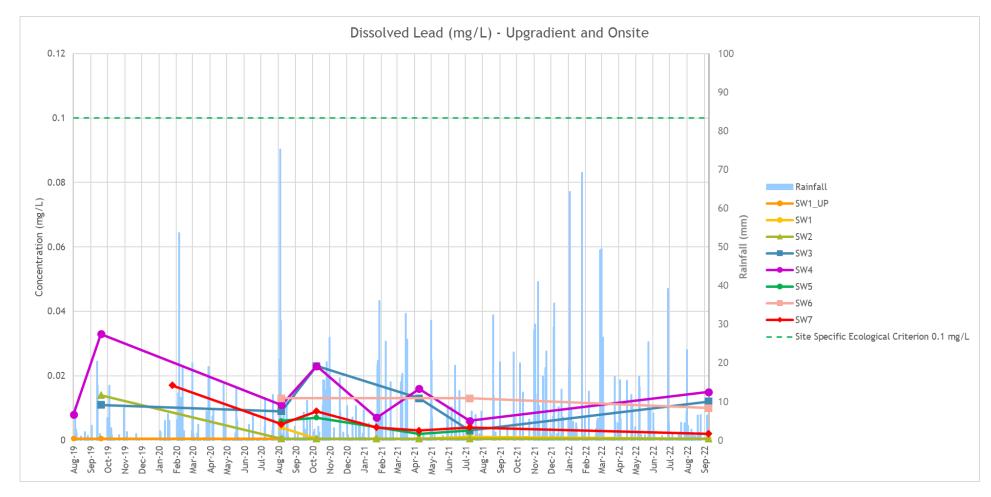

Figure 6-2: Upgradient and Onsite Dissolved Lead Concentration Trend

Concentration Trends Mulwaree River (Offsite)

Figure 6-3 presents total lead concentrations reported in surface water samples (SW8, SW9, SW10) collected from the Mulwaree River located offsite. Total lead concentrations in surface water samples are approximately 50-times lower than the adopted human health criterion for recreational water (0.1 mg/L). Therefore, the criterion has not been plotted on the y-axis of the graph in order to allow visual assessment of the low concentration trends. Total lead has not been detected above the laboratory PQL (0.001 mg/L) in surface water samples collected from the Mulwaree River since January 2021.

For the assessment of ecological risk, dissolved lead concentrations in samples collected from the Mulwaree River have been plotted relative to the adopted criterion for 95% protection of species protection in freshwater aquatic ecosystems (0.0034 mg/L), presented in **Figure 6-4**. All samples collected from the Mulwaree River to date have reported dissolved lead concentrations below the laboratory PQL and below adopted ecological criterion. Samples do not exceed the less sensitive guidelines for irrigation (0.1 mg/L) and stock water (5 mg/L).

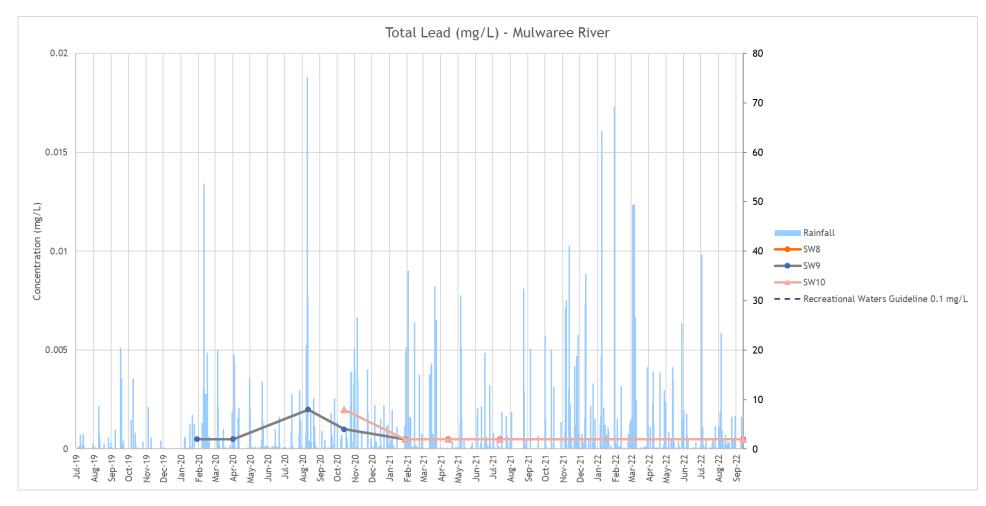

Figure 6-3: Mulwaree River (Offsite) Total Lead Concentration Trend

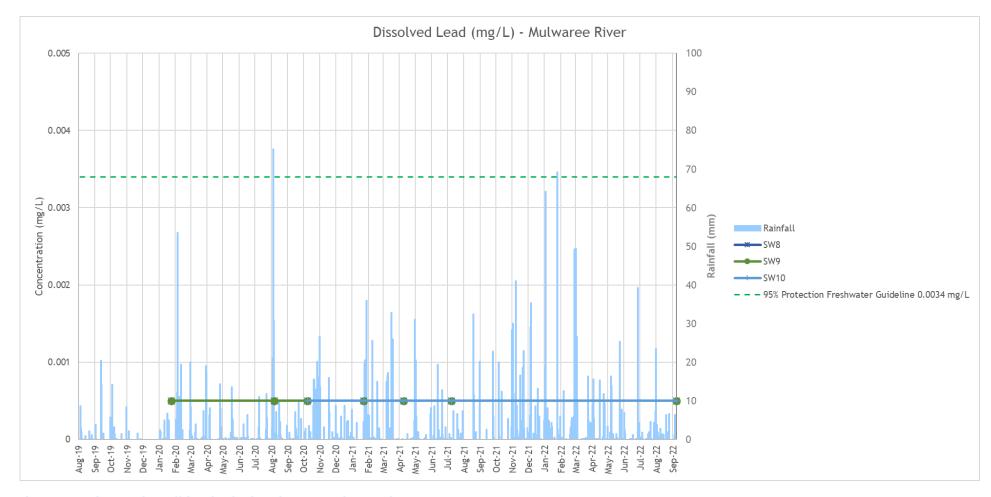

Figure 6-4: Mulwaree River Offsite Dissolved Lead Concentration Trend

6.1.4.2 Copper

Concentration Trends On and Near Site

Figure 6-5 presents the total copper concentration in surface water samples (SW1-UP, SW1 through to SW7) collected upstream and downstream of three onsite rail culverts. Total copper concentrations in surface water are approximately 66-times lower than the adopted human health criterion for recreational water (20 mg/L). Therefore, the criterion has not been plotted on the y-axis of the graph in order to allow visual assessment of the low concentration trends. All surface water samples collected on and near the Site to date have reported total copper concentrations below the human health criterion. Concentrations reported during September 2022 were largely consistent with the previous monitoring event (July 2021). Samples SW1-UP, SW1 and SW2, located upgradient to and at the southern culverts, have consistently reported total copper concentrations below or close to the laboratory PQL.

Figure 6-6 presents dissolved copper concentrations reported for the samples mentioned above, relative to the adopted site-specific ecological criterion (0.5 mg/L). All samples collected on and near the site to date reported dissolved copper concentrations below the site-specific ecological criterion.

Total and dissolved copper concentrations have historically been highest at SW4, located at the middle rail culvert. Recent monitoring events conducted in July 2021 and September 2022 have reported the highest concentrations at SW6, located at the northern rail culvert. SW7, located downgradient from the northern rail culvert, has consistently reported low copper concentrations (total and dissolved) when compared with remaining locations on or near the site.

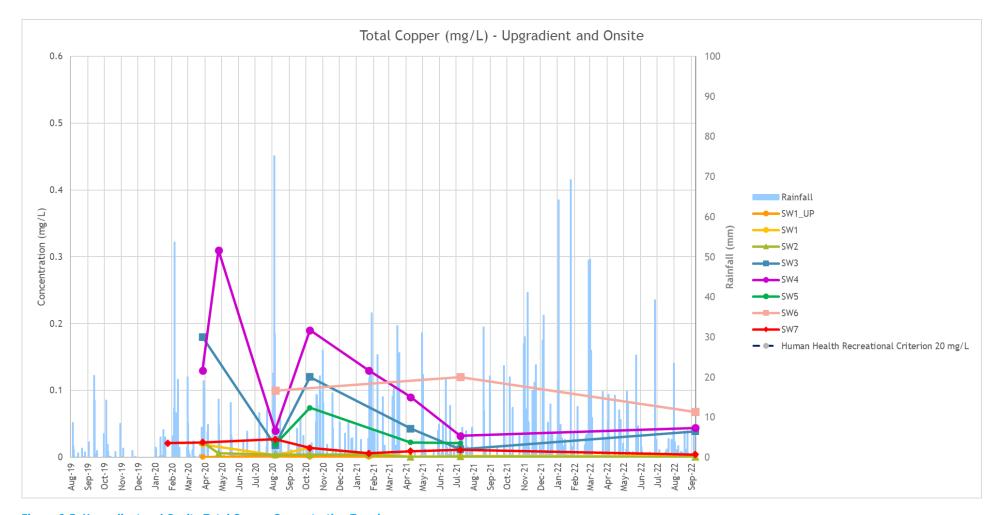

Figure 6-5: Upgradient and Onsite Total Copper Concentration Trend

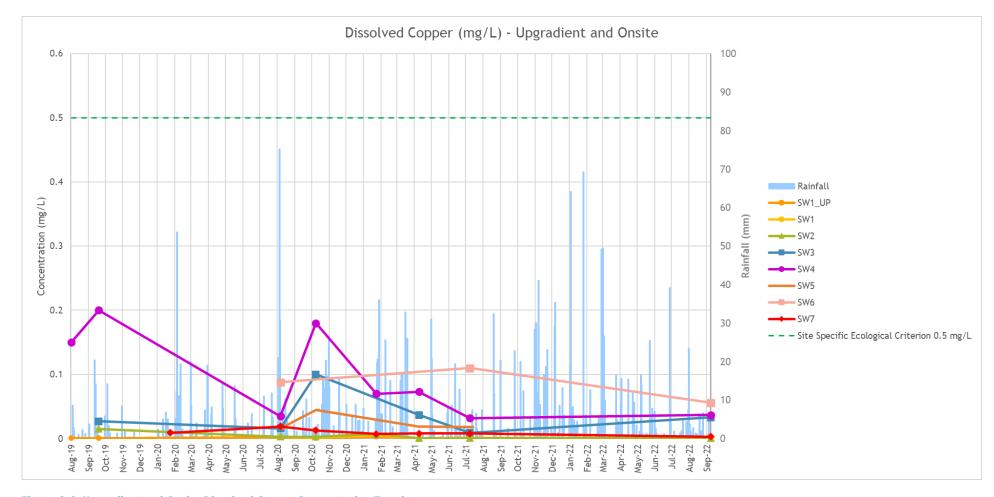

Figure 6-6: Upgradient and Onsite Dissolved Copper Concentration Trend

Concentration Trends Offsite

Figure 6-7 presents total copper concentrations reported in surface water samples (SW8, SW9, SW10) collected from the Mulwaree River located offsite. The data are shown relative to the human health criterion for recreational use (20 mg/L). The y-axis is presented on a logarithmic scale to allow for presentation of the relative variation in concentrations. All samples collected from the Mulwaree River to date have reported total copper concentrations below the human health assessment criterion. Similar concentrations have been reported in SW9 and SW8, located upstream and downstream of the Site, respectively with all locations reporting identical concentrations between October 2020 and September 2022. This indicates that total copper concentrations in the Mulwaree River are likely to be influenced by sources other than the Site and represent background conditions in the receiving waters.

Concentrations of dissolved copper in samples collected from the Mulwaree River relative to the adopted ecological assessment criterion (0.0014 mg/L) for 95% protection of freshwater species (ANZG, 2018) is presented in **Figure 6-8**. Dissolved copper concentrations exceeded the ecological assessment criterion for samples collected from the Mulwaree River in August 2020, January 2021, July 2021 and September 2022. Concentrations in all samples correlated closely, noting that sampling of the downstream location SW10 commenced in October 2020. Prior to April 2021, the highest dissolved copper concentrations were generally reported in SW9, located upstream. Dissolved copper concentrations in the Mulwaree River appear representative of background and not representative of impacts from the Site. Samples do not exceed the less sensitive guidelines for irrigation (0.5 mg/L) and stock water (0.1 mg/L).

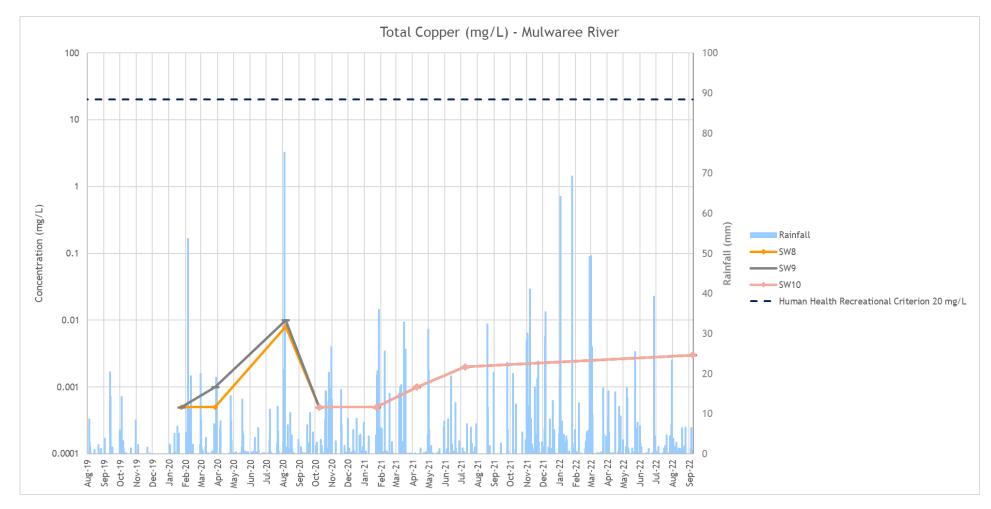

Figure 6-7: Mulwaree River (Offsite) Total Copper Concentration Trend - Logarithmic Scale

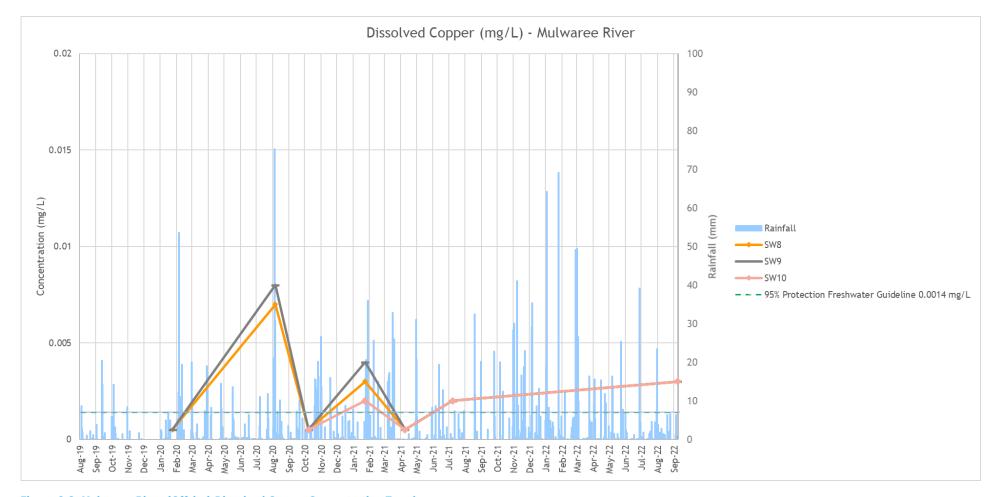

Figure 6-8: Mulwaree River (Offsite) Dissolved Copper Concentration Trend

6.1.4.3 Zinc

Concentration Trends On and Near the Site

Figure 6-9 presents total zinc concentrations reported in surface water samples (SW1-UP, SW1 through to SW7) collected upstream and downstream of three onsite rail culverts. The data are shown relative to the adopted site-specific criterion for human health (30 mg/L). The y-axis is presented as a logarithmic scale to allow for presentation of the relative variation in concentrations.

All surface water samples collected on and near the site to date have reported total zinc concentrations below the adopted human health criterion.

Figure 6-10 presents dissolved zinc concentrations reported for the samples described above, relative to the site-specific ecological criterion of 20 mg/L. All samples collected on and near the site to date have reported dissolved zinc concentrations below the adopted criteria. Concentrations have been reported at or below 2.6 mg/L and have remained largely stable since January 2021.

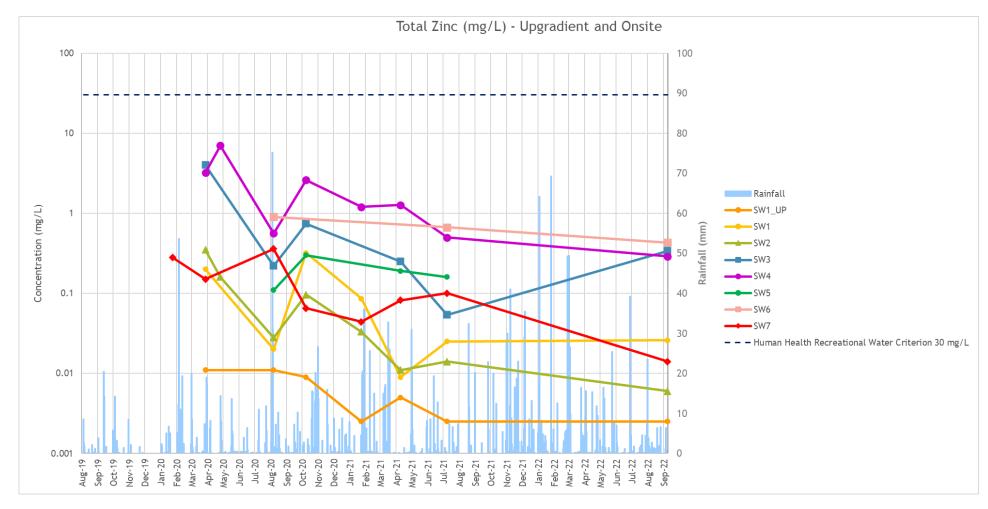

Figure 6-9: Upgradient and Onsite Total Zinc Concentration Trend - Logarithmic Scale

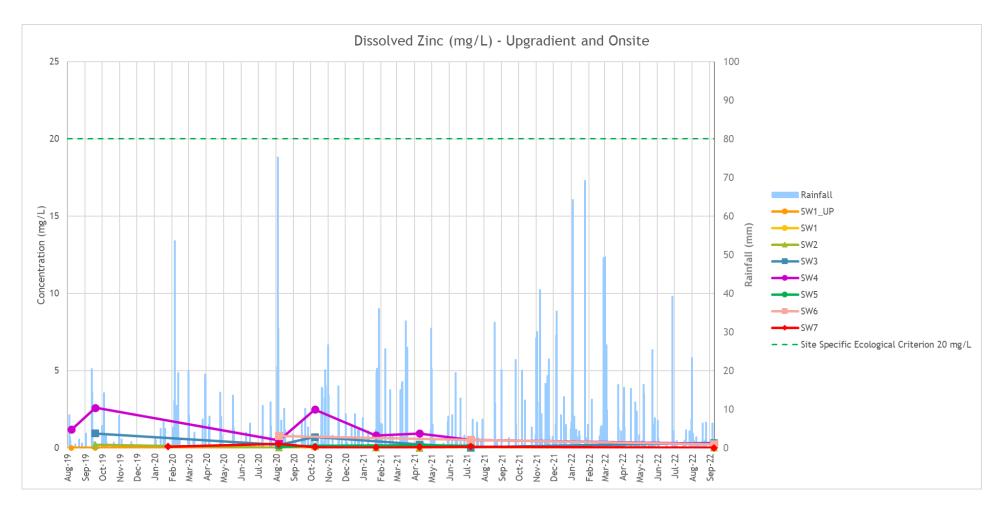

Figure 6-10: Upgradient and (Onsite) Dissolved Zinc Concentration Trend

Concentration Trends Offsite

Figure 6-11 presents total zinc concentrations in surface water samples (SW8, SW9, SW10) collected from the Mulwaree River located offsite. Total zinc concentrations in surface water are approximately 188-times lower than the adopted human health criterion for recreational water (30 mg/L). Therefore, the criterion has not been plotted on the y-axis of the graph in order to allow visual assessment of the low concentration trends. All samples collected from the Mulwaree River to date have reported concentrations below the adopted criteria. A minor increase (maximum 0.145 mg/L) at SW9 was identified following high rainfall in August 2020. Similar to copper, this increase in concentration was reported at both the upgradient (SW9) and downgradient (SW8) locations indicating a potential upstream contaminant source. A relationship between zinc in surface water from the Site and in the Mulwaree River was not identified.

Figure 6-12 presents dissolved zinc concentrations in samples collected form the Mulwaree River relative to the adopted ecological criterion (0.02 mg/L). Concentrations of dissolved zinc exceeded the adopted ecological criterion at SW8 and SW9 in August 2020 and at SW9 and SW10 in July 2021. All samples exceeded the adopted ecological criteria during the most recent monitoring event (September 2022). The upgradient location (SW9) has generally reported the highest concentrations of dissolved zinc in the Mulwaree River (with the exception of October 2020). Similar to copper, concentrations in the Mulwaree River appear representative of background and not representative of impacts from the Site. Samples do not exceed the less sensitive guidelines for irrigation (20 mg/L) and stock water (5 mg/L).

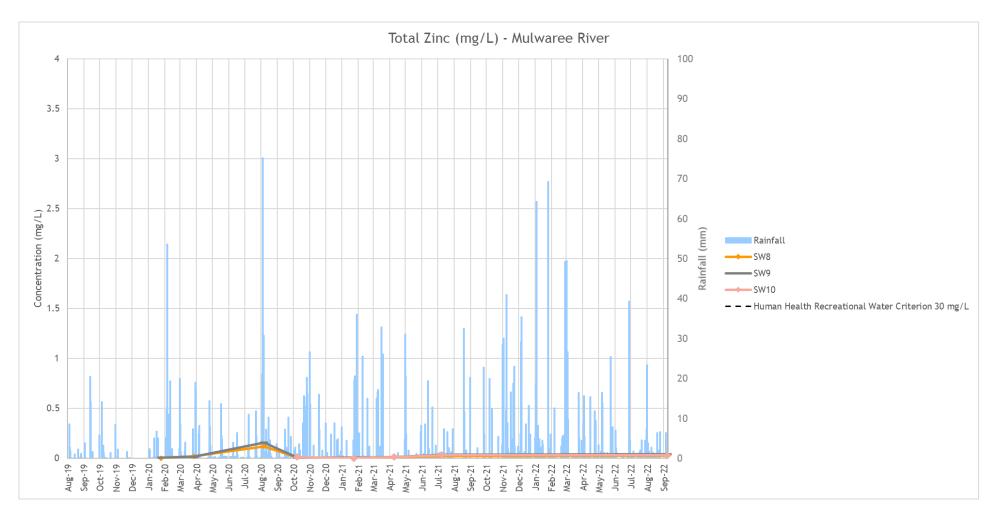

Figure 6-11: Mulwaree River (Offsite) Total Zinc Concentration Trend

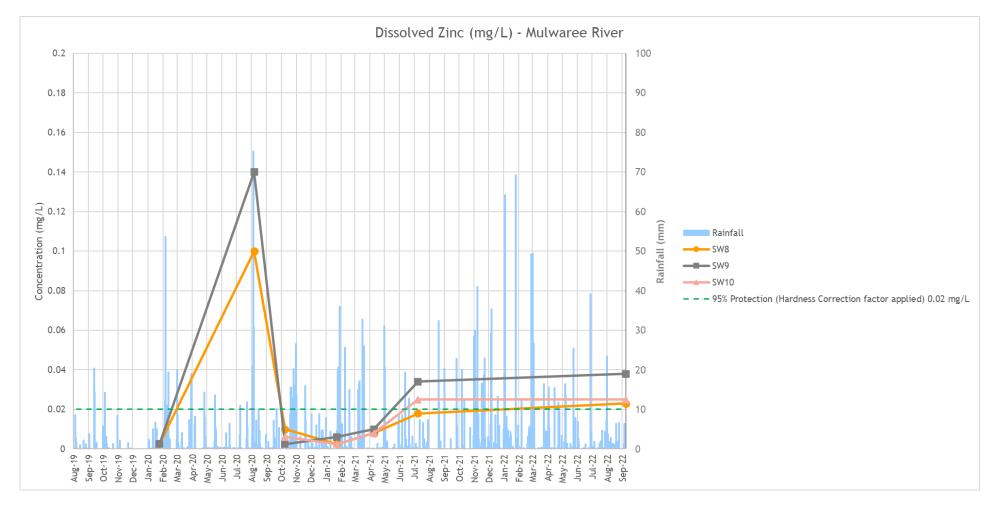

Figure 6-12: Mulwaree River (Offsite) Dissolved Zinc Concentration Trend

7. SUMMARY

A summary of CoPC results with regard for human health and ecological risk is presented in **Table 7-1**.

Table 7-1: CoPC Results Summary (Lead, Copper, Zinc)

Metal	Total/ Dissolved	Sample Location	Criteria	Summary	Assessment		
	Total	On and Near Site (SW1- UP, SW1, SW2, SW3, SW4, SW5, SW6, SW7)	Site-specific human health criterion of 7 mg/L (EnRiskS, 2021).	Concentrations of total lead were below the adopted human health criteria in all samples	Based on the monitoring data assessed, which accounts for some seasonal variation, the risk to human health from lead in surface		
		Mulwaree River/Offsite (SW8, SW9, SW10)	Recreational water criterion (0.1 mg/L).	collected to date.	water is considered to be low and acceptable.		
Lead		On and Near Site (SW1- UP, SW1, SW2, SW3, SW4, SW5, SW6, SW7)	Site-specific ecological criterion of 0.1 mg/L (EnRiskS, 2021).				
	Dissolved	Mulwaree River/Offsite (SW8, SW9, SW10)	95% species protection for freshwater ecosystems (0.0034 mg/L) (ANZG, 2018). ANZECC (2000) Freshwater guidelines for irrigation and stock water.	Concentrations of dissolved lead were below the adopted ecological assessment criterion in all sampled collected to date.	Risk to ecological receptors from lead in surface water was found to be low and acceptable.		
	Total	On and Near Site (SW1- UP, SW1, SW2, SW3, SW4, SW5, SW6, SW7)	Recreational water criterion (20 mg/L). - Recreational water	Concentrations of total copper were below the adopted human health criteria in all	The risk to human health from copper in surface water is considered low and		
		Mulwaree River/Offsite (SW8, SW9, SW10)	criterion (20 mg/L).	samples collected to date.	acceptable.		
Copper		On and Near Site (SW1- UP, SW1, SW2, SW3, SW4, SW5, SW6, SW7)	Site-specific ecological criterion of 0.5 mg/L (EnRiskS, 2021).	Concentrations of dissolved copper were below the adopted ecological criteria in all samples collected to date.	Risk to ecological receptors from the drainage system is low and acceptable.		
	Dissolved	Mulwaree River/Offsite (SW8, SW9, SW10)	95% species protection for freshwater ecosystems (0.0014 mg/L) (ANZG, 2018). ANZECC (2000) Freshwater guidelines for	Concentrations of dissolved copper exceeded the adopted ecological criteria in August 2020, January 2021, July 2021 and September 2022. The highest concentrations were generally reported in the upstream sample (SW9).	Exceedances of the ecological criteria at the upstream location does not indicate the Site as a source of contamination impacting the river.		

Metal	Total/ Dissolved	Sample Location	Criteria	Summary	Assessment
			irrigation and stock water.		
	Total	On and Near Site (SW1- UP, SW1, SW2, SW3, SW4, SW5, SW6, SW7)	Recreational water criterion (30 mg/L).	Concentrations of total zinc were below the adopted human health criteria in all samples	Risk to human health associated with zinc in the drainage system is considered to be low and acceptable.
	Total	Mulwaree River/Offsite (SW8, SW9, SW10)	Recreational water guideline of 30 mg/L.	collected to date.	Risks to human health associated with zinc in offsite surface water are considered to be low and acceptable.
Zinc		On and Near Site (SW1- UP, SW1, SW2, SW3, SW4, SW5, SW6, SW7)	Site-specific ecological criterion of 20 mg/L (EnRiskS, 2021).	Concentrations of dissolved zinc were below the adopted ecological criteria in all samples collected to date.	Risks to ecology associated with zinc in the drainage system is considered to be low and acceptable.
ZINC	Dissolved	Mulwaree River/Offsite (SW8, SW9, SW10)	95% species protection for freshwater ecosystems (ANZG, 2018) corrected for hardness (0.02 mg/L). ANZECC (2000) Freshwater guidelines for irrigation and stock water.	Concentrations of dissolved zinc exceeded the adopted ecological criterion at SW8 and SW9 in August 2020 and at SW9 and SW10 in July 2021. All samples exceeded the adopted ecological criteria during the most recent monitoring event (September 2022). The highest concentrations were generally reported in the upstream sample (SW9).	Exceedances of the ecological criteria at the upstream location does not indicate the Site as a source of contamination impacting the river.

8. CONCLUSIONS

Routine surface water monitoring was reinstated at Tarago NSW in September 2022 in response to a Prevention Notice issued by the NSW EPA to TfNSW. Surface water monitoring was completed between 12 and 13 September 2022. Results were compared against historical observations and relevant assessment criteria.

Monitoring results indicate no evidence of offsite migration of contaminants in surface water that would represent an unacceptable human health risk, with no reported exceedances in the adopted human health criteria for the contaminants of concern.

Similarly, monitoring results indicate no evidence of offsite migration of contaminants in surface water that would represent an unacceptable risk to ecology. Concentrations of lead, copper and zinc observed in the Mulwaree River are consistent with background concentrations and do not indicate impacts from the Site.

9. LIMITATIONS

Ramboll Australia Pty Ltd (Ramboll) prepared this report in accordance with the scope of work as outlined in our proposal (ref: P210) to TfNSW dated 2 September 2022 and in accordance with our understanding and interpretation of current regulatory standards.

A representative program of sampling and laboratory analyses was undertaken as part of this investigation, based on past and present known uses of the site. While every care has been taken, concentrations of contaminants measured may not be representative of conditions between the locations sampled and investigated. We cannot therefore preclude the presence of materials that may be hazardous. Site conditions may change over time. This report is based on conditions encountered at the Site at the time of the report and Ramboll disclaims responsibility for any changes that may have occurred after this time.

The conclusions presented in this report represent Ramboll's professional judgment based on information made available during the course of this assignment and are true and correct to the best of Ramboll's knowledge as at the date of the assessment.

Ramboll did not independently verify all of the written or oral information provided to Ramboll during the course of this investigation. While Ramboll has no reason to doubt the accuracy of the information provided to it, the report is complete and accurate only to the extent that the information provided to Ramboll was itself complete and accurate.

This report does not purport to give legal advice. This advice can only be given by qualified legal advisors.

9.1 User Reliance

This report has been prepared exclusively for TfNSW and may not be relied upon by any other person or entity without Ramboll's express written permission.

1. INTRODUCTION

1.1 Preamble

Ramboll Australia Pty Ltd (Ramboll) was engaged by Transport for NSW (TfNSW) to complete periodic surface water monitoring upstream and downstream of contamination within the Goulburn – Bombala rail corridor at Tarago, New South Wales, Australia.

1.2 Background

The site is identified as part Lot 22 Deposited Plan (DP) 1202608 and is located in Tarago, NSW. The site occupies an area of approximately three hectares and is located approximately 32 km south of Goulburn.

The Woodlawn Mines Ore Concentrate Load-Out Complex operated within the Goulburn – Bombala rail corridor at Tarago from the 1970s – 1990s. Concentrates were produced at the Woodlawn Mine approximately 6.5 km west and included a zinc concentrate consisting mainly of sphalerite (zinc sulphide), a lead concentrate of galena (lead sulphide) and copper concentrates of chalcopyrite (copper iron sulphide).

An extensive body of work has been completed to characterise contaminant impacts associated with historic operation of the site. This work has included assessment of soil, groundwater and surface water across the site and assessment of soil, groundwater, surface water and airborne dust within the surrounding area. Recent assessments identified contaminants within approximately 900 lineal meters of the rail formation at Tarago. This area is herein referred to as the 'site' and is presented on **Figure 1**, **Appendix 1**.

Offsite discharge of surface water appears to be generally related to three culverts which pass beneath the rail formation onsite. Contaminants of potential concern (CoPC) relevant to receiving surface waters appear limited to metals (aluminium, cadmium, copper, lead, nickel, zinc) which exceed the adopted relevant health and/or ecological assessment criteria.

1.3 Regulation

On 25 March 2020 the NSW Environment Protection Authority (NSW EPA) declared the site as significantly contaminated under Section 11 of the Contaminated Land Management Act 1997 (Declaration Number 20201103). Transport for NSW is currently managing the contamination under a Voluntary Management Proposal (VMP) which includes further assessment of site contamination and remediation to address the potential risks to human health and the environment posed by the contamination.

1.4 Objective

The objective of the surface water monitoring is to collect reliable water quality data, providing a data continuum which forms a basis for assessment of impacts from the site on surrounding surface water receptors.

2. SITE IDENTIFICATION

The site locality is shown in **Figure 1, Appendix 1**.

The site details are presented in **Table 2-1.**

Table 2-1: Site Identification

Information	Description
Street Address:	Accessed from Stewart Street and Goulburn Street Tarago NSW
Identifier:	Part Lot 1 DP 595856
Site Area:	Approximately 7.5 ha
Local Government:	Goulburn Mulwaree Shire
Owner:	Transport for NSW
Current Site Use:	Forms part of the Goulburn to Bombala rail line and the Country Regional rail Network (CRN)

3. REGULATORY REQUIREMENTS

This SAQP has been prepared in general accordance with the following guidance documents:

- 1. Australia and New Zealand Environment and Conservation Council, *Guidelines for Fresh and Marine Water Quality* (ANZECC, 2018)
- 2. National Environment Protection Council (NEPC), National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended 2013 (NEPM, 2013)
- 3. NSW EPA, Contaminated Sites: *Guidelines for Consultants Reporting on Contaminated Lands* (NSW EPA 2020)
- 4. NSW EPA, Guidelines for the Site Auditor Scheme (3rd Edition) (NSW EPA, 2017)

4. SUMMARY OF CONCEPTUAL SITE MODEL

A Conceptual Site Model (CSM) was prepared as part of a Detailed Site Investigation prepared by Ramboll (2020). The CSM provides a summary of the source-pathway-receptor linkages for surface water and is summarised in **Table 4-1**.

Table 4-1 Conceptual Site Model Summary

Exposure Pathway	Onsite Workers	Onsite Ecology	Residents	Community Activities	Offsite Workers	Offsite Ecology	Irrigation and Livestock
Surface Water							
Direct contact	N	P	N	N	N	Р	P
Incidental ingestion	N	P	N	N	N	P	P
Root uptake	N/A	P	N/A	N/A	N/A	Р	N/A
Migration to groundwater	N	P	N	N	N	P	P

5. ASSESSMENT CRITERIA

The criteria adopted for the assessment of surface water contamination are sourced from the following references:

- National Environment Protection Council (NEPC), National Environment Protection (Assessment of Site Contamination) Measure (NEPM) 1999, as amended 2013 (NEPC, 2013).
- National Health and Medical Research Council (NHMRC) (2001) National Resource
 Management Ministerial Council (NRMMC) Australian Drinking Water Guidelines 6, Version 3.6
 updated March 2021, (ADWG, 2011).
- National Health and Medical Research Council (NHMRC), National Resource Management Ministerial Council (NRMMC) Guidelines for Managing Risks in Recreational Water (NHMRC, 2008).
- Department of Environment and Conservation (DEC) *Guidelines for the Assessment and Management of Groundwater Contamination* (DEC, 2007).
- Australian and New Zealand Guidelines for Fresh and Marine Water Quality (ANZG, 2018) (available at www.waterquality.gov.au/anz-guidelines).
- Australian and New Zealand Environment and Conservation Council (ANZECC) & Agriculture and Resource Management Council of Australia and New Zealand (ARMCANZ) Australian and New Zealand Guidelines for Fresh and Marine Water Quality (ANZECC, 2000).
- Advice on risks to human health and the environment: Boyd Street and publicly accessible areas, Tarago NSW, Site specific criteria Protection of human health and terrestrial and/or aquatic ecosystems (EnRiskS, 2020).

5.1 Rationale for Application of Guidelines

The relevance of guidelines was determined based on iterative screening from the broadest and most sensitive water usage scenario which occurs in the Mulwaree River back through agricultural land and public roads to the least sensitive scenario which occurs at the Site.

All results from Mulwaree River samples (SW8 to SW10) have been screened against Tier 1 / screening guidelines relevant to human health (incidental ingestion), freshwater ecology, irrigation and stock watering as each of these receptors occur within the receiving waters (the Mulwaree River). Should results exceed screening guidelines and indicate site contamination as the source, it would be appropriate to apply the guidelines that were exceeded to sampling locations upstream as this would inform further assessment of the Site as the potential source. Previous monitoring results do not indicate site contamination is adversely affecting the Mulwaree River. Site-specific guidelines were developed for Arsenic, Cadmium, Lead, Manganese and Nickel (EnRiskS, 2020) that integrate the ephemeral nature of surface water features between the Mulwaree River and the Site. Additionally, several technical refinements were identified and are relevant to guideline application. These were:

- ADWG (2011) Section 6.3.1 states that guideline values refer to the total amount of the substance present, regardless of its form (e.g., in solution or attached to suspended matter) and so analytical results from unfiltered samples should be assessed against human health criteria. The primary human health risk from contaminants in surface water from the Site is via recreational use. NHMRC (2008) suggests that 10-times the ADWG values may provide a conservative estimate of acceptable recreational exposure guidelines values. This approach was applied to derive recreational exposure criteria.
- ANZG (2018) guidelines for metals in freshwater are adopted from the Australian and New Zealand Guidelines for Fresh and Marine Water Quality (ANZECC, 2000) which states the major toxic effect of metals comes from the dissolved fraction, so it is valid to filter samples (e.g., to 0.45 µm) and compare the filtered concentration against the trigger values.
- Water hardness is identified as a physical parameter with quantifiable effects. Correction factors are defined in the guidelines to address the effect of water hardness on the bioavailability of cadmium, chromium, lead, nickel and zinc.

To define appropriate hardness correction factors, water was conservatively presumed to be moderately hard based on the Goulburn Mulwaree Regional State of the Environment Report 2004-2009 (Goulburn Mulwaree Council, 2009). Hardness correction factors were adopted from Table 3.4.4 of the *Australian and New Zealand Guidelines for Fresh and Marine Water Quality* (ANZECC, 2000) to refine Tier 1 criteria as described in **Table 5-1** below.

Table 5-1: Hardness Corrections for Tier 1 Freshwater Ecology Guidelines

	Original guideline value (mg/L)	Hardness Correction Factor	Corrected guideline value (mg/L)
Cadmium	0.0002	2.7	0.00054
Chromium	0.001	2.5	0.0025
Lead	0.0034	4	0.0136
Nickel	0.011	2.5	0.0275
Zinc	0.008	2.5	0.02

Application of guidelines at each sampling point is summarised in **Table 5-2**.

Table 5-2: Guidelines Applied to Sampling Points

Sampling Point	Location	Human Health - Site Specific ¹	Ecology - Site Specific ¹	Human Health - Recreational Sceening ²	Ecology - Screening ³	Irrigation - Screening ³	Stock Water – Screening ³

NA – not applicable

blank cell denoted with – indicates no criterion available.

 $^{^{}a}$ Aluminium guidelines for pH > 6.5, based on the pH of groundwater measured at the Site and surrounding area. This is an aesthetic criteria only based on post flocculation problems

^b Guideline value for arsenic (III).

^c Guideline value for chromium (VI).

 $^{^{\}it d}$ Guideline value for inorganic mercury.

e 99% species protection level DGV has been adopted to account for the bioaccumulating nature of this contaminant.

f Guideline value for m-xylene. Guideline values also exist for both o-xylene and p-xylene as per ANZG (2018). The default guideline value for m-xylene guideline has been adopted as it is the most conservative

^g Hardness correction factor applied to the threshold value as detailed in ANZG 2018

^h Calculated using the ADWG (2011) aesthetic guideline. Insufficient data to set a guideline value based on health considerations

6. DATA QUALITY OBJECTIVES

To achieve the objectives and purpose of the surface water monitoring program, both the field and laboratory programs must result in data that is representative of the conditions at the site. As such, specific Data Quality Objectives (DQOs) have been developed for the tasks to be completed to validate the remediation of the site. The DQO process is a systematic, seven step process that defines the criteria that the validation sampling should satisfy in accordance with the *Guidelines for the NSW Site Auditor Scheme (3rd Edition)* (NSW EPA 2017).

The seven step DQOs process comprises:

- 1. Step 1: State the problem;
- 2. Step 2: Identify the decisions/ goal of the study;
- 3. Step 3: Identify the information inputs;
- 4. Step 4: Define the boundaries of the study;
- 5. Step 5: Develop the decision rules or analytical approach;
- 6. Step 6: Specify the performance or acceptance criteria;
- 7. Step 7: Develop the plan for obtaining data.

The seven step DQO process has been completed for surface water monitoring to be completed before, during and after site remediation.

6.1 Step 1: State the problem

Due to historic loadout of ore concentrate surface water flow over ore impacted soils has been identified to result in migration of total and dissolved metal concentrations from the site. The site has been declared significantly contaminated land by the NSW EPA and a VMP has been prepared to describe how associated risks to human health and the environment will be managed.

6.1.1 Contaminants of Concern

Contaminant of Concern relevant to receiving surface waters appear limited to metals (aluminium, cadmium, copper, lead, nickel, zinc) which exceed the adopted relevant health and/or ecological assessment criteria.

6.2 Step 2: Identify the decisions / goal of the study

The goal of the study is to assess the migration of metal(loid) contamination from the site in surface waters and the impact of migration to surface waters off site.

Based on the decision-making process for assessing urban redevelopment sites, detailed in the *NSW Site Auditor Guidelines, 3rd Edition 2017*, the following decisions must be made with respect to the targeted validation goals:

- 1. Is the data collected of sufficient quality to meet the project objectives?
- 2. Is the data reliable?
- 3. What is the fate and transport of contaminant offsite?
- 4. What are the potential risks to human health and the environment?

6.3 Step 3: Identify the information inputs

Inputs to the decisions will be sourced from:

- 1. Review of historical surface water monitoring results
- 2. Physico-chemical properties collected for each of the 10 surface water sampling locations
- 3. Sampling of surface water and analysis for contaminants of concern

- 4. Analytical results for metal(loid)s in surface water samples from each of the 10 sampling locations
- 5. Quality Assurance / Quality Control data review
- 6. Comparison of the above samples to the assessment criteria outlined in Section 5.
- 7. All sample analyses conducted using National Association of Testing Authorities (NATA) registered methods in accordance with ANZECC (1996) and NEPC (1999) guidelines
- 8. All samples appropriately preserved and handled in accordance with the sampling methodology
- 9. PQLs less that the adopted assessment criteria

6.4 Step 4: Definition of the Study Boundary

The spatial boundaries are shown on **Figure 1** and include:

- 1. Three tributaries of the Mulwaree River, one located approximately 100 m west of the rail corridor at CH. 262.600, one adjacent to a culvert on the western side of the rail line at CH 262.600 and one adjacent a culvert on the eastern side of the rail line at CH 262.600.
- 2. Four locations adjacent to culverts, one western side of the rail line at CH 262.300, one on the eastern side of the rail line at CH 262.300, one on the western side of the rail line at CH 262.000 and one on the eastern side of the rail line at CH 262.000.
- 3. The dam located downgradient from the site northern rail culvert forming part Lot A DP 440822, and three locations along the Mulwaree River

The vertical boundaries are limited to the depth of surface waters encountered and accessible.

The temporal boundary includes historical surface water results as well as data collected under this SAQP comprising quarterly monitoring events over pre-remediation, remediation and postremediation periods. Two post remediation surface water monitoring events will be included in the validation report.

6.5 Step 5: Develop the decision rules or analytical approach

The decisions rules for this investigation are as follows:

- 1. Has contaminant migration via surface water been adequately assessed?
- 2. Have contaminant impacts to surface water off site been adequately assessed?
- 3. Is the data reliable?
- 4. Does the data define clear presence / absence of unacceptable risk when assessed against Tier 1 criteria?
- 5. If Tier 1 assessment of risk is not clear, then does Tier 2 / Tier 3 risk assessment define absence of unacceptable risk?
- 6. Are there any remaining data gaps?

6.6 Step 6: Specify the performance or acceptance criteria

- 6.6.1 The tolerable limits on decision errors are as follows:
 - 1. Probability that 95% of data will satisfy the DQIs, therefore a limit on decision error will be 5% that a conclusive statement may be incorrect:
 - a. A 5% probability of a false negative (i.e. assessing that the average concentration of contaminants of concern are less than the assessment criteria when they are not); and
 - b. A 5% probability of a false positive (i.e. assessing that the average concentration of contaminants of concern are more than the assessment criteria when they are not).

The potential for significant errors will be minimised by:

- Completion of QA/QC measures of the investigation data to assess if the data satisfies the DQIs.
- 2. Assessment of whether appropriate sampling and analytical densities were completed for the purposes of the investigation.
- 3. Ensuring that the criteria set for the investigation were appropriate for the land use.

DQIs have been established to set acceptance limits on field and laboratory data collected as part of the investigation and are discussed further below.

6.6.2 Evaluation of Analytical Data

Acceptable limits and the manner of addressing possible decision errors for laboratory analysis associated with water quality monitoring and verification of imported materials are outlined below.

Accuracy: Accuracy is defined as the nearness of a result to the true value, where all random errors have been statistically removed. Internal accuracy is measured using percent recovery '%R' and external accuracy is measured using the Relative Percent Difference '%RPD'.

Internal accuracy will be tested utilising:

Surrogates	Surrogates are QC monitoring spikes, which are added to all field and QA/QC samples at the beginning of the sample extraction process in the laboratory, where applicable. Surrogates are closely related to the organic target analytes being measured, are to be spiked at similar concentrations, and are not normally found in the natural environment;
Laboratory control samples	An externally prepared and supplied reference material containing representative analytes under investigation. These will be undertaken at a frequency of one per analytical batch.

Matrix spikes Field samples which are injected with a known concentration of contaminant and then tested to determine the potential for

adsorption onto the matrix. These will be undertaken at a

frequency of 5%.

Recovery data shall be categorised into one of the following control limits:

 70%-130%R confirming acceptable data, note that there are some larger %R for intractable substances.

External accuracy will be determined by the submission of inter-laboratory duplicates at a frequency of 5%. Data will be analysed in accordance with the following control limits:

• 70%-130%R confirming acceptable data, note that there are some larger %R for intractable substances.

Any data which does not conform to these acceptance criteria will be examined for determination of suitability for the purpose of site characterisation.

Precision: The degree to which data generated from replicate or repetitive measurements differ from one another due to random errors. Precision is measured using the standard deviation 'SD' or Relative Percent Difference '%RPD'.

Internal precision will be determined by the undertaking of laboratory duplicates, where two sub samples from a submitted sample are analysed. These will be undertaken at a frequency of 10%. A RPD analysis is calculated and results compared to:

 70%-130%R confirming acceptable data, note that there are some larger %R for intractable substances.

Any data which does not conform to these acceptance criteria will be examined for determination of suitability for the purpose of site characterisation.

External precision will be determined by the submission of intra-laboratory duplicates at a frequency of 5%. The external duplicate samples are to be obtained by mixing and then splitting the primary sample to create two identical sub samples. Field duplicate samples are to be labelled with a unique identification that does not reveal the association between the primary and duplicate samples e.g., QA1.

It must be noted that significant variation in duplicate results is often observed (particularly for solid matrix samples) due to sample heterogeneity or concentrations reported near the Practical Quantification Limit (PQL).

A RPD analysis is calculated and results compared to:

• 70%-130%R confirming acceptable data, note that there are some larger %R for intractable substances.

Any data which does not conform to these acceptance criteria will be examined for determination of suitability for the purpose of site characterisation.

Blank samples will be submitted with the analytical samples and analysed for the contaminants of concern One field blank will be collected and analysed per matrix type for each batch samples/each day.

The laboratory will additionally undertake a method blank with each analytical batch of samples. Laboratory method blank analyses are to be below the PQLs. Results shall be examined, and any positive results shall be examined. Positive blank results may not be subtracted from sample results.

Positive results may be acceptable if sample analyte concentrations are significantly greater than the amount reported in the blank (ten times for laboratory reagents such as methylene chloride, chloroform, and acetone etc., and five times for all other analytes). Alternatively, the laboratory PQL may be raised to accommodate blank anomalies provided that regulatory guidelines are not compromised by any adjustment made to the PQL.

Completeness: The completeness of the data set shall be judged as:

- 1. The percentage of data retrieved from the field compared to the proposed scope of works. The acceptance criterion is 95%.
- 2. The percentage of data regarded as acceptable based on the above data quality objectives. 95% of the retrieved data must be reliable.
- 3. The reliability of data based on cumulative sub-standard performance of data quality objectives.
- 4. All PQLs are below adopted assessment criteria.

Where two or more data quality objectives indicate less reliability than what the acceptance criteria dictates, the data will be considered with uncertainty.

Representativeness: Sufficient samples must have been collected.

Samples must be collected and preserved in accordance with the sampling methodology proposed in Step 7 to ensure that the sample is representative of the assessed stratum.

Comparability: The data must show little to no inconsistencies with results and field observations and include likely associates e.g. TPH C6-C9 and BTEX.

Decision Error Protocol

If the data received is not in accordance with the defined acceptable limits outlined in Step 6, it may be considered to be an estimate or be rejected. Determination of whether this data may be used or if re-sampling is required will be based on the following considerations:

- 1. Closeness of the result to the guideline concentrations.
- 2. Specific contaminant of concern (e.g. response to carcinogens may be more conservative).
- 3. The area of site and the potential lateral and vertical extent of questionable information.
- 5. Whether the uncertainty can be effectively incorporated into site management controls.

6.7 Step 7: Develop a plan for obtaining data

The overall design of the sampling plan considers migration of surface water from the site. Further detail is provided in **Section 7**.

7. SAMPLING PLAN

The sampling plan for surface water quality will be based on quarterly monitoring events over pre-remediation, remediation and post-remediation periods. Two post remediation surface water monitoring events will be included in the validation report.

Surface water sampling will target conditions upstream and downstream of three culverts which direct surface water beneath the rail formation onsite. Surface water at the site only occurs after rainfall and is received to the surrounding environment as follows:

- 1. Water passing through the northern culvert discharges to an adjacent agricultural property and during high rainfall events to a dam on the agricultural property.
- 2. Water passing through the middle culvert discharges across a causeway on Boyd Street to an adjacent vacant block.
- 3. Water passing through the southern culvert discharges beneath Goulburn Street to agricultural land in a tributary to the Mulwaree River (approximately 550m east of site)

Surface water samples will be collected upstream and downstream of each culvert and in receiving water bodies as shown on **Figure 1**, **Appendix 1**.

7.1.1 Water Quality Monitoring Performance Criteria

Surface water sampling will be completed in accordance with performance criteria defined in **Table 7-1**.

Table 7-1 Performance Criteria

Category	Validation Criteria
Accuracy: Accuracy in the collection of field data will be	Calibrated measurement equipment used. The water quality meter will be calibrated by the technical rental company prior to use.
controlled by:	2. Appropriate sampling methodologies utilised and complied with. Works to be completed with regard for AS NZS 5667.6-1998 Water quality - Sampling - Guidance on sampling of rivers and streams.
	3. Collection of one intra-laboratory duplicate for surface water.
	4. Rinsate samples are not proposed to be collected due to surface water samples being collected directly into dedicated sampling containers (or field filtered using single use syringes and filters) using disposable nitrile gloves.
Precision: The degree to which	1. A new pair of disposable nitrile gloves to handle each sample.
data generated from replicate or repetitive measurements differ from one another due to random	2. Samples will be placed immediately into laboratory supplied and appropriately preserved sampling vessels.
errors. Precision of field data will be maintained by:	3. Samples will be stored in chilled, insulated containers with ice for transportation to the laboratory.
	 Sample numbers, preservation and analytical requirements will be recorded on chain of custody documents.
	5. Samples will be transported to the laboratory under chain of custody conditions.
Completeness: The completeness of the data set shall be judged by:	 All locations sampled as outlined in Sections 7.1.1 and Figure 1, Appendix 1.
	2. Sampling completed by experienced personnel.
	3. Field documentation completed correctly.
Representativeness: The representativeness of the field data will be judged by:	 Non-disposable sampling equipment, such as the grab sampler and water quality meter, will be thoroughly decontaminated between locations using Decon 90 solution and deionised rinsate water.
	At each location, a pair of disposable nitrile gloves will be worn while sampling and handling the sample; gloves will be replaced between each successive sample.
	3. Surface water analytical samples will be collected directly into the sampling vessels using an extendable pole sampler where appropriate.
Comparability: Comparability to	Use of the same appropriate sampling methodologies.
existing field data will be maintained by:	2. Same sampling depths for surface water (where practical).
manitanieu by.	 Field water quality parameters will be obtained using a calibrated water quality meter and recorded on a field sheet, comprising pH, temperature, total dissolved solids (TDS), dissolved oxygen (DO), redox potential and electrical conductivity (EC).

Category	Validation Criteria
	4. Samples for dissolved metal analysis will collected in dedicated disposable 50 mL plastic syringes and field filtered through 0.45 µm filters directly into a sample bottle containing acid preservative.
	5. Visual and olfactory observations will also be recorded on the field sheet.
	Photographs will be taken of sampling location conditions at the time of sampling.

8. REPORTING

On completion of each monitoring event, a report will be prepared documenting the completed sampling, trend analysis, quality assurance / quality control and laboratory reports.

The report shall include the following:

- 1. Executive summary
- 2. Introduction
- 3. Objectives and scope of work
- 4. Summary of completed field sampling and laboratory analysis
- 5. QA/QC review
- 6. Temporal trend analysis
- 7. Conclusions

Certificate of Calibration

This is to certify that the above instrument has been calibrated to the following specifications:

Sensor	Serial no	Standard Solutions	Certified	Solution Bottle Number	Instrument Reading
1. EC		2.76mS		385041	2.76mS
2. Temp		20.6°C		Testo	19.9°C
3. pH 4		pH 4.00		389384	pH 3.89
4. pH 7		pH 7.00		381241	pH 6.95
6. DO		0ppm		379624	0ppm
7.Turbidity		50NTU		386950	48.22 NTU
8. mV		238.7mV		385070/387771	238.7 mV

Calibrated by: Alex Buist

Calibration date: 9/09/2022

Next calibration due: 9/10/2022

Table 10: SW8 Analytical Results

- indicates no criterion available

LOR = Limit of Reporting

Concentrations below the LOR noted as <value

NOC = No observed contamination

Australian and New Zealand Guidelines for Fresh and Marine Water Quality (ANZG 2018)

Australia and New Zealand Environment and Conservation Council (2000) Australian and New Zealand Guidelines for Fresh and Marine Water Quality.

ANZECC, NEPM and NHMRC guidelines for mercury are based on total mercury.

BenRiskS (2020) Advice on risks to human health and the environment: Boyd Street and publicly accessible areas, Tarago NSW

CANZG (2018) Australian and New Zealand Guidelines for Fresh and Marine Water Quality.

^cANZG (2018) Australian and New Zealand Guidelines for Fresh and Marine Water Quality.

The recreational criteria for aluminium is based on aesthtic issues post flocculation and is not indicative of risks to human health. Concentrations in blue font exceed human health recreational screening criteria Concentrations in grey box exceed ecological screening criteria Concentrations in bold exceed irrigation screening criteria Concentrations in hold exceed irrigation screening criteria Concentrations in italics exceed stockwatering screening criteria

Sample Information

A detailed list of analytes logged into our LIMS, is included in the attached summary table.

All samples have been received as described on the above COC.

COC has been completed correctly.

Attempt to chill was evident.

Appropriately preserved sample containers have been used.

All samples were received in good condition.

Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.

Appropriate sample containers have been used.

Sample containers for volatile analysis received with zero headspace.

Split sample sent to requested external lab.

Some samples have been subcontracted.

N/A Custody Seals intact (if used).

Notes

Contact

If you have any questions with respect to these samples, please contact your Analytical Services Manager:

Andrew Black on phone: (+61) 2 9900 8490 or by email: AndrewBlack@eurofins.com

Results will be delivered electronically via email to Stephen Maxwell - smaxwell@ramboll.com.

Note: A copy of these results will also be delivered to the general Ramboll Australia Pty Ltd email address.

Sample History

Where samples are submitted/analysed over several days, the last date of extraction is reported.

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
Heavy Metals	Sydney	Sep 20, 2022	28 Days
- Method: LTM-MET-3040 Metals in Waters, Soils & Sediments by ICP-MS			
Heavy Metals (filtered)	Sydney	Sep 20, 2022	180 Days
- Method: LTM-MET-3040 Metals in Waters, Soils & Sediments by ICP-MS			
Mercury (filtered)	Sydney	Sep 20, 2022	28 Days
- Method: I TM-MET-3040 Metals in Waters, Soils & Sediments by ICP-MS

Internal Quality Control Review and Glossary

General

- Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples follows guidelines delineated in the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended May 2013 and are included in this QC report where applicable. Additional QC data may be available on request.
- 2. All soil/sediment/solid results are reported on a dry basis, unless otherwise stated.
- 3. All biota/food results are reported on a wet weight basis on the edible portion, unless otherwise stated.
- Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
- 5. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds
- 6. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
- 7. Samples were analysed on an 'as received' basis.
- 8. Information identified on this report with blue colour, indicates data provided by customer that may have an impact on the results.
- This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the SRA

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether the holding time is 7 days however for all other VOCs such as BTEX or C6-10 TRH then the holding time is 14 days.

Units

mg/kg: milligrams per kilogram mg/L: milligrams per litre μg/L: micrograms per litre

ppm: parts per million ppb: parts per billion %: Percentage

org/100 mL: Organisms per 100 millilitres NTU: Nephelometric Turbidity Units MPN/100 mL: Most Probable Number of organisms per 100 millilitres

Terms

COC Chain of Custody

CP Client Parent - QC was performed on samples pertaining to this report CRM Certified Reference Material (ISO17034) - reported as percent recovery

Where a moisture has been determined on a solid sample the result is expressed on a dry basis Dry

A second piece of analysis from the same sample and reported in the same units as the result to show comparison. Duplicate

LOR

LCS Laboratory Control Sample - reported as percent recovery.

In the case of solid samples these are performed on laboratory certified clean sands and in the case of water samples these are performed on de-ionised water. Method Blank NCP Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within.

RPD Relative Percent Difference between two Duplicate pieces of analysis SPIKE Addition of the analyte to the sample and reported as percentage recovery.

SRA Sample Receipt Advice

Surr - Surrogate The addition of a like compound to the analyte target and reported as percentage recovery.

твто Tributyltin oxide (bis-tributyltin oxide) - individual tributyltin compounds cannot be identified separately in the environment however free tributyltin was measured

and its values were converted stoichiometrically into tributyltin oxide for comparison with regulatory limits

TCLF Toxicity Characteristic Leaching Procedure TEQ Toxic Equivalency Quotient or Total Equivalence

QC - Acceptance Criteria

The acceptance criteria should be used as a guide only and may be different when site specific Sampling Analysis and Quality Plan (SAQP) have been implemented

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR: No Limit

Results between 10-20 times the LOR: RPD must lie between 0-50%

Results >20 times the LOR: RPD must lie between 0-30% NOTE: pH duplicates are reported as a range not as RPD

Surrogate Recoveries: Recoveries must lie between 20-130% for Speciated Phenols & 50-150% for PFAS

PFAS field samples that contain surrogate recoveries in excess of the QC limit designated in QSM 5.4 where no positive PFAS results have been reported have been reviewed and no data was affected.

QC Data General Comments

- 1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided
- 2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
- pH and Free Chlorine analysed in the laboratory Analysis on this test must begin within 30 minutes of sampling. Therefore, laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt
- 4. Recovery Data (Spikes & Surrogates) where chromatographic interference does not allow the determination of recovery the term "INT" appears against that analyte.
- 5. For Matrix Spikes and LCS results a dash "-" in the report means that the specific analyte was not added to the QC sample.
- 6. Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

General Comments

This report contains the following information:

- Sample Container(s)/Preservation Non-Compliances
- Summary of Sample(s) and Requested Analysis
- Proactive Holding Time Report
- Requested Deliverables
- Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Analytical work for this work order will be conducted at ALS Sydney.
- Sample Disposal Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

• No sample container / preservation non-compliance exists.

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such VATER - EG020T otal Metals by ICP/MS (including digestion) as the determination of moisture content and preparation tasks, that are included in the package. If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date issolved Metals by ICP/MS is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component WATER - W-02 3 Metals Matrix: WATER Sample ID Laboratory sample Sampling date / ID time ES2233470-001 12-Sep-2022 00:00 T01

Proactive Holding Time Report

Sample(s) have been received within the recommended holding times for the requested analysis.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key: CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.

LOR = Limit of reporting

- ^ = This result is computed from individual analyte detections at or above the level of reporting
- ø = ALS is not NATA accredited for these tests.
- ~ = Indicates an estimated value.
- EG035: Poor matrix spike recovery was obtained for Mercury on sample ES2233276 #2. Confirmed by reanalysis.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key: Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot

CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.

LOR = Limit of reporting

RPD = Relative Percentage Difference

= Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

QA/QC Compliance Assessment to assist with Quality Review

Work Order : **ES2233470** Page : 1 of 4

Client : RAMBOLL AUSTRALIA PTY LTD Laboratory : Environmental Division Sydney

Contact : MITCHELL MACDONALD Telephone : +61-2-8784 8555

Project : 318001376 Tarago Rail Corridor Quarterly Surface Water Date Samples Received : 19-Sep-2022

Investigation

Site :--- Issue Date : 27-Sep-2022

Sampler : Mitchell MacDonald No. of samples received : 1
Order number : 318001376 No. of samples analysed : 1

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers: Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- NO Method Blank value outliers occur.
- NO Duplicate outliers occur.
- NO Laboratory Control outliers occur.
- Matrix Spike outliers exist please see following pages for full details.
- For all regular sample matrices, NO surrogate recovery outliers occur.

Outliers: Analysis Holding Time Compliance

NO Analysis Holding Time Outliers exist.

Outliers: Frequency of Quality Control Samples

NO Quality Control Sample Frequency Outliers exist.

Project 318001376 Tarago Rail Corridor Quarterly Surface Water Investigation

Outliers: Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: WATER

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment	
Matrix Spike (MS) Recoveries								
EG035T: Total Recoverable Mercury by FIMS	ES2233276002	Anonymous	Mercury	7439-97-6	14.3 %	70.0-130%	Recovery less than lower data quality	
							objective	

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for <u>VOC in soils</u> vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: WATER				Evaluation	: 🗴 = Holding time	breach ; ✓ = Withi	n holding time
Method	Sample Date	Extraction / Preparation			Analysis		
Container / Client Sample ID(s)		Date extracted	Due for extraction	Evaluation	Date analysed	Due for analysis	Evaluation

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

ne expected rate. A listing of breaches is provided in the Summary of Outliers.

Quality Control Sample Type		C	ount		Rate (%)		Quality Control Specification

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Dissolved Metals by ICP-MS - Suite A	EG020A-F	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. Samples are 0.45µm filtered prior to analysis. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
Total Metals by ICP-MS - Suite A	EG020A-T	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
Dissolved Mercury by FIMS	EG035F	WATER	In house: Referenced to APHA 3112 Hg - B (Flow-injection (SnCl2)(Cold Vapour generation) AAS) Samples are 0.45µm filtered prior to analysis. FIM-AAS is an automated flameless atomic absorption technique. A bromate/bromide reagent is used to oxidise any organic mercury compounds in the filtered sample. The ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM Schedule B(3).
Total Mercury by FIMS	EG035T	WATER	In house: Referenced to APHA 3112 Hg - B (Flow-injection (SnCl2)(Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. A bromate/bromide reagent is used to oxidise any organic mercury compounds in the unfiltered sample. The ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM Schedule B(3).
Preparation Methods	Method	Matrix	Method Descriptions
Digestion for Total Recoverable Metals	EN25	WATER	In house: Referenced to USEPA SW846-3005. Method 3005 is a Nitric/Hydrochloric acid digestion procedure used to prepare surface and ground water samples for analysis by ICPAES or ICPMS. This method is compliant with NEPM Schedule B(3)
