# Henry Lawson Drive Upgrade - Stage 1B 

Traffic and Transport Impact Assessment
Transport for NSW
Reference: 520566
Revision: 4
2023-06-07
äurecon
Sringing ideas to life

## Executive Summary

## Background

Transport for NSW (Transport) is investigating the upgrade of 7.5-kilometre stretch of Henry Lawson Drive between the M5 Motorway at Milperra and the Hume Highway at Lansdowne. The route corridor of Henry Lawson Drive serves as a major north-south link for movement of freight and general traffic. The land use in the vicinity of the corridor includes a mix of residential, industrial and retail land use as well as airport facilities. The upgrade would help in ensuring that the road corridor can meet growing traffic demand, with residential, commercial, and industrial development expected to increase in the coming years.

The upgrade would be carried out in four stages (Stages 1A, 1B, 2 and 3). In June 2018, the NSW Roads Minister and the Treasurer announced $\$ 100$ million for upgrading of Henry Lawson Drive between Tower Road and the M5 Motorway (Stages 1A and 1B).

The Stage 1A upgrade of Henry Lawson Drive would provide more capacity for vehicles travelling through the intersection of Henry Lawson Drive, Milperra Road and Newbridge Road. It would improve efficiency along the corridor and safety for motorists and pedestrians.

This proposal, Stage 1B, involves an upgrade of Henry Lawson Drive along a 1.8-kilometre section between Auld Avenue, Milperra and the approach to the M5 Motorway. This includes road widening to increase traffic capacity and improve travel time as well as upgrades of key intersections to enhance capacity and driver safety.

This Traffic and Transport Impact Assessment has been prepared to assess the potential traffic and transport impacts of the Stage 1B proposal. It would support a Review of Environmental Factors (REF) being prepared by Transport under Division 5.1 of the Environmental Planning and Assessment Act 1979 (EP\&A Act).

## Proposal overview

Key features of the proposal would include:

- widening Henry Lawson Drive from two to four lanes between Auld Avenue, Milperra and the M5 Motorway, Milperra with a raised central median
- upgrading the Henry Lawson Drive / Bullecourt Avenue signalised intersection, including:
- an additional right-turn lane from Henry Lawson Drive (northbound) to Bullecourt Avenue (two rightturn lanes total)
- an additional right-turn lane from Bullecourt Avenue to Henry Lawson Drive (northbound) (two rightturn lanes total)
- converting the existing dedicated left-turn lane from Bullecourt Avenue to Henry Lawson Drive (southbound) into a dedicated left-turn slip lane
- maintaining the dedicated left-turn lane from Henry Lawson Drive (southbound) to Bullecourt Avenue
- a new dedicated right-turn lane from Henry Lawson Drive (southbound) to Pozieres Avenue
- a new dedicated left-turn lane from Henry Lawson Drive (northbound) to Pozieres Avenue and relocation of the existing bus stop north of the intersection
- providing a new two-lane local link road between Auld Avenue and Keys Parade (about 160 metres), crossing over Milperra Drain, providing access to / from southbound lanes of Henry Lawson Drive and Auld Avenue, and removing up to eight parking spaces on Auld Avenue to accommodate the link road
extending Raleigh Road about 120 metres to connect with Keys Parade at a roundabout, and removing the direct connection between Raleigh Road and Henry Lawson Drive
- converting the Henry Lawson Drive intersections to be left-in left-out only, at:
- Ruthven Avenue
- Whittle Avenue
- Amiens Avenue
- Ganmain Crescent
- Fromelles Avenue
- Hermies Avenue
- modifying the Bullecourt Avenue / Ashford Avenue intersection to better accommodate heavy vehicle movements
- constructing a three-metre-wide shared path:
- on the western side of Henry Lawson Drive between Pozieres Avenue and Keys Parade
- along Keys Parade, the new Auld Avenue local link road and the extended section of Raleigh Road
reconstruction of some existing shared paths within the proposal area
constructing a new footpath within the proposal area:
- on the eastern side of Henry Lawson Drive between the Flower Power and Ingram Avenue
- along the northern side of Ingram Avenue
- along the eastern side of Fromelles Avenue
- installing new drainage infrastructure and water quality controls within the proposal area, including:
- an upgraded longitudinal and transverse drainage pits and pipes network along Henry Lawson Drive
- a bioretention basin between Henry Lawson Drive, Bullecourt Avenue and Fleurbaix Avenue and maintenance access to this basin
- swales along Henry Lawson Drive and Keys Parade and installation of Gross Pollutant Traps
construction activities and ancillary work, including:
- relocation of utilities (including electrical, gas, water and telecommunications)
- civil earthworks, drainage work, water quality controls and tie-in work to adjoining sections of Henry Lawson Drive and local roads
- final roadworks including pavement, kerb and gutters, signs, road furniture, landscaping, lighting and line marking
- new traffic signals and intelligent transport systems including, but not limited to, closed-circuit television
- establishment of temporary ancillary facilities to support construction, including compound sites, site offices, stockpile and laydown locations, temporary access tracks and water quality devices.

The concept design would be further refined during detailed design to minimise environmental and social impacts and to consider community feedback to the exhibition of the REF.

## Operational traffic impact assessment

## Road network changes

The following road network changes would be incorporated:

- Henry Lawson Drive/ Keys Parade intersection upgrade
- Widening to four lanes on Henry Lawson Drive between Auld Avenue and approach of the M5 Motorway
- Henry Lawson Drive/ Bullecourt Avenue intersection upgrade
- Henry Lawson Drive/ Pozieres Avenue intersection upgrade
- Henry Lawson Drive/ Raleigh Road intersection upgrade
- Henry Lawson Drive/ Ruthven Avenue intersection upgrade
- Henry Lawson Drive/ Whittle Avenue intersection upgrade
- Henry Lawson Drive/ Amiens Avenue intersection upgrade
- Henry Lawson Drive/ Ganmain crescent/ Fromelles Avenue intersection upgrade
- Henry Lawson Drive / Hermies Avenue intersection upgrade
- Link road between Auld Avenue and Keys Parade
- Link road between Raleigh Road and Keys Parade

## Impact on network performance

A microsimulation model of the study area was created to identify the operational impact of the proposal on intersections, travel times, and network statistics for the years 2031 and 2041, compared to a 'without proposal' scenario.

The traffic assessment was based on:

- two scenarios along Henry Lawson Drive - the 'without proposal' scenario and the 'with proposal' scenario
- both scenarios modelled for the opening year (2031) and ten years after (2041)
- the future year traffic demands from the 2021, 2031 and 2041 STFM sub-area matrices and link volume plots provided by Transport for NSW.
The modelling results have been assessed in the form of overall network statistics, corridor travel time and key intersection delay, including the Level of Service (LOS). In general, for the future 'with proposal' scenario would result in slightly better performance compared to the 'without proposal' scenario in AM, PM and weekend peaks for both 2031 and 2041 due to improved network average speed with the proposal.

## Henry Lawson Drive Travel Time

- The 2031 AM peak period in the 'with proposal' scenario shows an average reduction in travel time in the northbound and southbound directions compared to the 'without proposal' scenario. In 2041, there would be an increase in travel times in the northbound direction in the 'with proposal' scenario compared to the 'without proposal' scenario, with the opposite result in the southbound direction. This would be due to queue spill back at the Bullecourt Avenue / Henry Lawson Drive intersection.
- During PM peak periods, Henry Lawson Drive northbound travel time is expected to decrease by more than three minutes in 2031 and by three minutes in 2041 in the 'with proposal' scenario compared to the 'without proposal' scenario. This is due to there being higher demand for northbound traffic in 2041. The average southbound travel time along Henry Lawson Drive is expected to decrease by about 30 seconds in the 'with proposal' scenario compared to the 'without proposal' scenario in both 2031 and 2041. The network would be able to accommodate southbound demand in both 2031 and 2041.
- During the weekend peak in 2031, the average northbound and southbound travel times along Henry Lawson Drive are likely to be similar in both the 'without proposal' and 'with proposal' scenarios. The average southbound travel time along Henry Lawson Drive is expected to reduce by about 20 seconds in the 'with proposal' scenario compared to the 'without proposal' scenario in 2041, with northbound travel times improving by only four seconds on average. This is due to the network being able to accommodate weekend demand in both 2031 and 2041.
- Travel time results suggest a better performance for the 'with proposal' scenario compared to the 'without proposal' scenario in all time periods modelled, with the 2041 AM peak period being an exception.

## Level of Service (LOS)

- Intersection LOS at Keys Parade and Bullecourt Avenue have similar results for the 'without proposal' and 'with proposal' scenarios in the 2031 AM peak period. This is because a good percentage of vehicles who currently use Milperra Road to reach Bullecourt Avenue in the 'without proposal' scenario, would reroute to use Henry Lawson Drive in the 'with proposal' scenario.
- For 2041 AM peak period, in the 'with proposal' scenario, the Bullecourt Avenue intersection operates at LOS C in the first hour and deteriorates to LOS F in the second hour. This is because the right turn traffic movement from Henry Lawson Drive northbound onto Bullecourt Avenue queues back due to capacity constraint along Bullecourt Avenue between Henry Lawson Drive and Ashford Avenue, originating at the Ashford Avenue roundabout. The increase in delay at the intersection is due to an increasing number of vehicles turning at the Henry Lawson Drive / Bullecourt Avenue intersection. In the 'without proposal' scenario, they would use Milperra Road and Ashford Avenue (if travelling from north of the proposal area) or turn directly into the local road network (if travelling northbound on Henry Lawson Drive). This traffic congestion propagates further downstream impacting the performance of the Pozieres Avenue intersection.
- For both 2031 and 2041 scenarios, the results suggest a better performance for the 'with proposal' scenario in comparison to the 'without proposal' scenario in the weekday PM peak period. The weekend modelling produces similar results for the 'without proposal' scenario and the 'with proposal' scenario.
- In general, the 2041 AM and PM peak periods show that the delays would increase impacting the LOS at signalised intersections within the proposal area in comparison to the 2031 AM and PM due to increased demand in 2041. However, in the 2041 weekend peak for the 'without proposal' and 'with proposal' scenarios, the overall LOS would not differ substantially from the 2031 modelled values.
- It should be noted that the Henry Lawson Drive traffic performance would likely see the most benefit once the entire Henry Lawson Drive upgrade program is completed. With only the Stage 1A and Stage 1B upgrades, the merging from two to one lane located north of the Tower Road intersection acts as a bottleneck, impacting the performance of vehicles travelling along the corridor.

## Impact on property access

During operation, the proposal would maintain access to all properties within the proposal area.
There are five residential properties within the proposal area with direct access to Henry Lawson Drive (497, 499, 503, 553, 553A Henry Lawson Drive, Milperra). 497, 499 and 503 Henry Lawson Drive are located south of the Flower Power Garden Centre and 553 and 553A Henry Lawson Drive are located south of the Hermies Avenue intersection.

For 497, 499 and 503 Henry Lawson Drive, due to the installation of a raised concrete median along Henry Lawson Drive, driveway access would be converted to left-in left-out only. Residents wishing to turn right into their properties would need to use local road detours to access their properties. There would also be adjustments to driveway connections for these properties within the existing road reserve owned by Transport.

For 553 and 553A Henry Lawson Drive, driveway access would also be converted to left-in left-out only. This would be due to the Henry Lawson Drive / Hermies Avenue intersection only permitting left turning vehicles into the kerbside lane to travel south through the Pozieres Avenue intersection. To access the northbound carriageway of Henry Lawson Drive, residents would need to turn around at either Bransgrove Road or Maxwell Avenue, Panania (about 750 metres south of their properties).

The proposal would require adjustments to driveway connections to local roads to the Milperra Sports Centre, at the BP Service Station (5 Bullecourt Avenue, Milperra) and at some residential properties adjacent to road or footpath work on Ingram Avenue and Fromelles Avenue. These driveway connections would be within the existing road reserve owned by Canterbury Bankstown Council.

Landowners and occupiers would be consulted about any potential access impacts prior to and during construction.

## Impact on local road access

The proposal would involve installation of a raised concrete median along Henry Lawson Drive within the proposal area, which would convert a number of local road intersections to be left-in left-out only. The concept design proposes left-in left-out only access at the Henry Lawson Drive intersections of Ruthven Avenue, Whittle Avenue, Amiens Avenue, Ganmain Crescent, Fromelles Avenue and Hermies Avenue. Local residents wishing to turn right from Henry Lawson Drive into these local roads would need to turn right at signalised intersections of Keys Parade, Bullecourt Avenue or Pozieres Avenue to access the local road network to access these local roads.

At Hermies Avenue, a raised lane barrier would be installed so that vehicles from Hermies Avenue cannot switch lanes to turn into Pozieres Avenue and must continue to the south.

The proposal would also provide a local link road between Auld Avenue and Keys Parade, extension of Raleigh Road to Keys Parade and roundabout at the Raleigh Road / Keys Parade intersection. These features would provide new local road access routes to the south-west of Henry Lawson Drive to minimise disruption to motorists of the local road access changes.

## Impact on public transport

The operation of the proposal would not result in any changes to existing public or school bus services. Bus stops on local roads including on Amiens Avenue, Bullecourt Avenue and Pozieres Avenue would be retained. Most bus stops along Henry Lawson Drive would be retained with like-for-like replacement of the existing bus stop (where relevant).

However, the bus stop located on the Henry Lawson Drive northbound carriageway, south of Pozieres Avenue intersection would be relocated about 25 metres north of Pozieres Avenue.

## Impact on active transport

A three-metre-wide concrete shared path is proposed along the western length of Henry Lawson Drive Stage 1B upgrade between the M5 Motorway and Keys Parade.

The existing pedestrian and cyclist movements would be maintained along the length of Henry Lawson Drive:

- between the M5 Motorway and Pozieres Avenue
- between northern end of Ganmain Crescent and eastern end of Ruthven Avenue
- between western end of Ruthven Avenue and Keys Parade.

This concrete pathway would still connect to the existing pedestrian crossing at Henry Lawson Drive/ Pozieres Avenue intersection.

## Impact on road safety

Whilst no dedicated road safety upgrades have been undertaken in the preferred Proposal design, the increased intersection capacity and smoother operation of the network in general is expected to significantly improve road safety. Additionally, the following intersection upgrades are expected to improve road safety:

- Henry Lawson Drive intersections of Auld Avenue, Ruthven Avenue, Whittle Avenue, Amiens Avenue, Ganmain Crescent, Fromelles Avenue and Hermies Avenue. Henry Lawson Drive / Auld Avenue
- Conversion of intersection into a left-in left-out reduces risk of vehicles turning into oncoming traffic
- Henry Lawson Drive / Bullecourt Avenue intersection
- Provision of additional right turn bays would increase turn storage capacity and reduce risk of road blockage and rear end collisions.
- Conversion of left turn exit lane from Bullecourt Avenue into slip lane would improve safety of that turn.
- Henry Lawson Drive / Pozieres Avenue intersection
- Provision of right and left turn bays would increase turn storage capacity and reduce risk of road blockage and rear end collisions.
- Relocation of the Pozieres Avenue bus stop about 25 metres north from its current location would improve passenger embarking and disembarking and traffic and pedestrian movements at the intersection.

## 1 <br> Introduction

Transport for NSW (Transport) proposes to upgrade Henry Lawson Drive along a 1.8-kilometre section between Auld Avenue, Milperra and the M5 Motorway, Milperra (the proposal). The proposal would include widening Henry Lawson Drive from two to four lanes, constructing a new local link road between Auld Avenue and Keys Parade, extending Raleigh Road and modifying the Bullecourt Avenue / Ashford Avenue intersection. Further details on the proposal are provided in Section 4. This Traffic and Transport Impact Assessment has been prepared to assess the potential traffic and transport impacts of the proposal. It would support a Review of Environmental Factors (REF) being prepared by Transport under Division 5.1 of the Environmental Planning and Assessment Act 1979 (EP\&A Act).

### 1.1 Proposal background

The proposal forms part of the progressive upgrade to 7.5 kilometres of Henry Lawson Drive between the intersections of Hume Highway, Lansdowne, and the M5 South Western Motorway, Milperra.

The Henry Lawson Drive upgrade would be carried out in four stages (Stages 1A, 1B, 2 and 3) as presented in Figure 1-1. In June 2018, the NSW Roads Minister and the Treasurer announced $\$ 100$ million for upgrading of Henry Lawson Drive between Tower Road and the M5 Motorway (Stages 1A and 1B).

This Henry Lawson Drive upgrade would improve traffic capacity, decrease travel time and enhance driver safety.

Figure 1-1: Henry Lawson Drive delivery stages

### 1.2 Proposal location and setting

The proposal is located around 20 kilometres south west of the Sydney CBD in the City of CanterburyBankstown local government area (LGA). The proposal is situated mainly along Henry Lawson Drive and includes intersection upgrades at Keys Parade, Raleigh Road, Ruthven Avenue, Amiens Avenue, Whittle Avenue, Bullecourt Avenue, Ganmain Crescent, Fromelles Avenue, Hermies Avenue and Pozieres Avenue.

Henry Lawson Drive is a key connection for traffic moving between the Hume Highway, Milperra Road / Newbridge Road and the M5 Motorway. It is also used for local travel trips between residences and services. In terms of heavy vehicle access, Henry Lawson Drive is designated as a B-Double access route that connects surrounding large industrial areas of Milperra, Revesby, Chipping Norton and Moorebank.

The proposal passes through the suburb of Milperra with Bankstown Golf Course and Flower Power in the north east of the proposal, recreational areas in the north west.

The proposal is shown in Figure 1-2 as an overview, with Figure 1-3 to Figure 1-7 presenting key features along each segment of the proposal.

Figure 1-6: Key features of the proposal - Henry Lawson Drive / Pozieres Avenue segment

Figure 1-7: Key features of the proposal - Bullecourt Avenue / Ashford Avenue segment

The proposed Stage 1B upgrades include:

- Widening of Henry Lawson Drive section from Keys Parade and the approach to the M5 Motorway to two lanes: The section between Keys Parade to the approach of the M5 Motorway is proposed to be widened to four lanes with two lanes either direction. Figure 1-3 to Figure 1-5 presents the proposed section between Keys Parade and Bullecourt Avenue and Figure 1-5 to Figure 1-6 presents the proposed section between the Bullecourt Avenue and approach to the M5 Motorway. The upgrades are described as follows:
- All unsignalised intersections along this section are proposed to be a "left-in and left-out" to Henry Lawson Drive. This includes Ruthven Avenue, Whittle Avenue, Amiens Avenue, Ganmain Crescent, Fromelles Avenue and Hermies Avenue.
- The Raleigh Road / Henry Lawson Drive intersection would be removed, and Raleigh Road would be extended north to Keys Parade. This would provide access to traffic coming from Raleigh Road to access Henry Lawson Drive via Keys Parade and vice versa.
- Upgrades to the existing signalised intersections of Keys Parade / Henry Lawson Drive, Bullecourt Avenue / Henry Lawson Drive and Pozieres Avenue / Henry Lawson Drive. These are discussed separately in this section.
- Henry Lawson Drive/ Keys Parade intersection upgrade and a Link Road connection between Auld Avenue and Keys Parade: Figure 1-3 presents the proposed layout of the Keys Parade / Henry Lawson Drive intersection. The intersection upgrades are described as follows:
- The creation of a left turn slip lane northbound on Henry Lawson Drive to Keys Parade.
- The widening of Henry Lawson Drive northbound to accommodate two through lanes and a right turn lane for vehicles turning into Flower Power.
- The widening of Henry Lawson Drive southbound to accommodate two through lanes and two right turn lanes for vehicles turning into Keys Parade. The existing left-hand slip lane into Flower Power would be maintained.
- The creation of a two-lane local link road between Auld Avenue and Keys Parade.
- Henry Lawson Drive/ Bullecourt Avenue intersection upgrade: Figure 1-5 presents the proposed layout of the intersection. The intersection upgrades are:
- The widening of Henry Lawson Drive southbound to accommodate a 40-metre left turn lane from Henry Lawson Drive to Bullecourt Avenue.
- The widening of Henry Lawson Drive northbound accommodate two through lanes continuing northbound and two right turn lanes into Bullecourt Avenue.
- The creation of a left turn slip lane to Henry Lawson Drive from Bullecourt Avenue.
- The widening of Bullecourt Avenue from Fleurbaix Avenue to the Henry Lawson Drive intersection to accommodate two right turn lanes and one left turn slip lane onto Henry Lawson Drive.

Henry Lawson Drive/ Pozieres Avenue upgrade: Figure 1-6 presents the proposed layout of the intersection. The intersection upgrades are:

- The widening of Henry Lawson Drive northbound to accommodate a 60 -metre left turn lane from Henry Lawson Drive to Pozieres Avenue.
- The widening of Henry Lawson Drive southbound to three lanes to increase the capacity for right turn lane from Henry Lawson Drive to Pozieres Avenue.
- The use of solid line on Henry Lawson Drive southbound for the left- most lane between Hermies Avenue to Pozieres Avenue to stopping traffic switching lanes through this section.

### 1.3 Strategic plans and policies

There are a number of strategic plans and strategies that are relevant to the proposal. These include:

- Transport Road Network Plan - Henry Lawson Drive and Woodville Road
- Future Transport Strategy
- Greater Sydney Region Plan
- NSW Freight and Ports Strategy
- NSW Road Safety Plan 2021
- Transport draft walking and cycling policy

### 1.3.1 Transport Road Network Plan - Henry Lawson Drive and Woodville Road

The Henry Lawson Drive and Woodville Road network plan provides a framework for the development and management of Henry Lawson Drive / Woodville Road, based on the network's strategic movement and place function and customer needs. The plan outlines the following objective statements:

- A safe road system for every customer supporting the Towards Zero vision of zero fatalities and serious injuries on NSW roads by 2056.
- Improve travel time and reliability for key customer group (freight and car users) along the corridor to support and enhance its function as a primary north-south link between the M5 and Parramatta.
- Support access to safe crossing opportunities of the corridor for active modes, for both commuting and recreational uses, linking local centres, and transport interchanges on parallel rail lines.
- Facilitate the efficient, safe and reliable movement of goods along the corridor and beyond, supporting the growth of freight precincts such as Yennora, Villawood and Bankstown Airport, the metropolitan centre of Parramatta and strategic centres of Fairfield and Bankstown.
- Integrate current and future land use planning with road network development to ensure compatible and complementary uses and functions.

The proposal would help achieve the objectives of the road network plan through the increased capacity of the Henry Lawson Drive, improving travel times and enhancing driver safety, as well as improve connectivity and safety for active transport users.

### 1.3.2 Future Transport Strategy

The Future Transport Strategy is part of a suite of strategies, policies and plans that integrate and guide long-term land use, transport planning, and the design, delivery and management of transport. It sets the strategic directions for Transport to achieve world-leading mobility for customers, communities, businesses and our people. It was released in September 2022 and replaces Future Transport 2056, which was published in 2018.

This Strategy was updated to address significant economic trends and events including the COVID-19 pandemic, the energy transition, the digital economy, enduring natural disasters and global upheaval. It also considers population growth, new and emerging technology, global megatrends and the impacts of climate change. It includes ground-breaking ideas to revitalise six cities, connect regional communities, encourage thriving local neighbourhoods, and build on that economic success.

The Future Transport Strategy considers every part of our transport system from planning to operations to ensure we have a fully integrated approach. It sets the direction for localised plans and strategies, policy direction and prioritisation. The aim is to connect customers and communities with a safe, reliable, sustainable and integrated transport system, and to help guide the allocation of transport funding to build future cities, towns and regions.

The Future Transport Strategy focuses on getting more out of our existing investments, by reallocating road space to more efficient modes of transport like buses, walking, cycling and micro mobility devices. Stronger investment in public transport, walking and cycling networks would offer convenient alternatives to driving and build a sustainable transport system. Better public transport can make our cities and towns stronger and more sustainable, with seamless networks that deliver more convenient door-to-door journeys. It would embed intelligent sensors and digital systems to improve the real-time management, efficiency and reliability of our networks; prioritise public transport and freight vehicles; and ensure our roads are ready for Connected and Automated Vehicles (CAV).

The proposal would help to alleviate congestion and improve travel times through improvements to existing infrastructure along Henry Lawson Drive and surrounding local roads. It would also improve freight networks and increase freight capacity, thereby aligning with the strategic objectives of the Future Transport Strategy.

### 1.3.3 Greater Sydney Region Plan

The Greater Sydney Region Plan: A Metropolis of Three Cities (GSRP) outlines the vision to transform Greater Sydney into a metropolis of three cities:

- The established Eastern Harbour City - building on its recognised economic strength and addressing liveability and sustainability.
- The developing Central River City - investing in a wide variety of infrastructure and services and improving amenity.
- The emerging Western Parkland City - establishing the framework for the development and success of an emerging new city.
The proposal is located within the developed Central River City. The GSRP highlights the importance of providing infrastructure to support cities, while also having the ability to adapt to meet the needs of future growth. The proposal would contribute to meeting these objectives through the upgrading of infrastructure on Henry Lawson Drive and its connecting roads. This would increase traffic efficiency for local road users and provide for future growth by allowing greater traffic capacity at key intersections.
One of the GSRP objectives also focuses on ensuring the freight and logistics network is competitive and efficient. It highlights the importance of locations surrounding key freight networks and ensuring they are not adversely impacted by traffic patterns and congestion. The upgrade of Henry Lawson Drive would contribute to achieving the GSRP objectives relating to freight and logistic networks through the provision of additional capacity in the direct study area. This would also benefit the community through decreasing traffic congestion on local roads, improving access within the neighbouring communities and providing increased active transport opportunities.

### 1.3.4 NSW Freight and Ports Plan 2018-2023

In September 2018, Transport released the Freight and Ports Plan 2018-2023 (FPP) as a supporting plan to the Future Transport Strategy. The FPP was released to provide a guide for the freight industry over a fiveyear period to make the long-term investments required to benefit the freight industry as well as the State's future growth (Transport 2018c). The main aim of the FPP is for the industry and government to work together to achieve the following objectives:

- Objective 1: Economic growth
- Objective 2: Efficiency, connectivity and access
- Objective 3: Capacity
- Objective 4: Safety
- Objective 5: Sustainability

The proposal aligns closely with the objectives of the FPP through the upgrade of Henry Lawson Drive to increase capacity to address existing congestion issues and accommodate growth. In doing so, the proposal would improve efficiency and provide better connectivity and access for the community and all road users.

The FPP discusses the contribution that congestion makes to the cost of moving freight, particularly around high-density urban areas (Transport 2018c). The proposal would aim to improve freight efficiency and reduce vehicle operating costs on the road network through the upgrade of Henry Lawson Drive.

### 1.3.5 Road Safety Plan 2021

The Road Safety Plan 2021 (Road Safety Plan) was established to guide the improvement of road safety in NSW. The plan is based on consultation with the NSW community to identify trends and key issues that can be responded to. The international 'Safe System Approach' is adopted in the plan to achieve the NSW target of 'zero fatalities and serious injuries on our roads by 2056' (Transport, 2018d).

The steps to achieving a safer system that align closely with the proposal include creating safer urban places and communities and building a safe future. Developing 'liveable and safe urban communities' is a priority area highlighted in the Road Safety Plan. Actions that are discussed to achieve this include exploring safety upgrades at intersections in the proposal design (Transport, 2018d). The proposal would upgrade Henry Lawson Drive including intersections to improve road safety outcomes for all road users. This includes motorists, pedestrians and cyclists. This would have benefits for current and future people living and travelling through the proposal area, contributing to the liveability of the community through the provision of safer infrastructure and connections.

### 1.3.6 Providing for Walking and Cycling in Transport Projects Policy, 2021

The Walking and Cycling Policy outlines Transport's recognition that walking and cycling are integral to the greater good of communities. This policy requires that every transport project funded by Transport includes provision for walking and cycling within the core scope of the project.

The proposal aligns with this policy, improving active transport connectivity through the construction of new shared paths and footpaths through the proposal area

The proposal would provide greater active transport linkage along Henry Lawson Drive, through the development of a three-metre-wide shared use path and footpaths along Henry Lawson Drive in the proposal area. These would connect with existing active transport facilities in the area.

## 2 Methodology

### 2.1 Study process

The methodology for this traffic and transport assessment consisted of:

- Reviewing the existing and future conditions of the transport network within and surrounding the proposal using publicly available information as well as data that had been previously collected for the proposal.
- Preparing a microsimulation traffic model for the concept design of the proposal using AIMSUN 20.0.3 software from TSS (Transport Simulation Systems).
- Modelling the traffic performance of the concept design for several scenarios within the study area.
- Assessing the impacts of the proposal on traffic and transport performance during construction and operational stages.
- Recommending management measures to minimise potential traffic or transport impacts from the proposal.

Further details on the methodology are provided in the following sections. The base model calibration and validation report is provided at Appendix $A$ and the Future option modelling report is provided at Appendix $B$.

### 2.2 Study area

The study area for Stage 1B adopted in this assessment extends about 1.8 km along Henry Lawson Drive in Milperra from Auld Avenue to the M5 Motorway as shown in Figure 2-1.

The traffic modelling also considered a broader road network (the model study area) than the immediate study area subject to the proposal to:

- Incorporate future projects in the area that would result in increased traffic volumes or changed traffic movements through the proposal area
- Assess the impacts of the proposal on the broader road network.

The model study area covers Henry Lawson Drive between Hume Highway and the M5 Motorway as shown in Figure 2-1. The traffic modelling results in this report detail the impacts of the proposal on intersections and the local road network in the Henry Lawson Drive Stage 1B study area. The intersections in the Stage 1B study area included:

1. Henry Lawson Drive / Keys Parade
2. Henry Lawson Drive / Raleigh Road
3. Henry Lawson Drive / Ruthven Avenue
4. Henry Lawson Drive / Whittle Avenue
5. Henry Lawson Drive / Amiens Avenue
6. Henry Lawson Drive / Bullecourt Ave
7. Henry Lawson Drive / Fromelles Avenue / Ganmain Crescent
8. Henry Lawson Drive / Hermies Avenue
9. Henry Lawson Drive / Pozieres Ave

Figure 2-1: Henry Lawson Drive Stage 1B model study area with Stage 1B upgrade

### 2.3 Detailed modelling method

AIMSUN microsimulation software was chosen as the modelling software which would allow analysis of the intersection performance, and key changes on the road network as a result of the proposal. This software allows reporting of travel times, delays and queuing at signalised and non-signalised intersections and geometric conditions.

The traffic modelling required development of:

- A calibrated and validated Existing traffic model that accurately represents traffic conditions observed within the study area and is suitable for analysing network performance and acting as a benchmark to evaluate performance of the future year scenarios.
- Future year traffic models that draw on the Existing model and Strategic Traffic Forecasting Model (STFM) to compare the expected traffic conditions with and without the proposal under forecast traffic volumes.

Further details on the inputs, Existing and assessment scenario development are detailed in the following sections.

It should be noted that the traffic model was based on the following considerations:

- Traffic surveys were undertaken in 2022, and as such reduced traffic levels during COVID-19 lockdown is not a concern. For the base model, the traffic count data has been sourced from MATRIX surveys undertaken mostly during 2022 for Stage 1B and 2018 for Stage 1A. The traffic counts used for model calibration are therefore a mix of both 2022 and 2018 traffic data. It has however been verified that the collected dates are representative of typical day traffic conditions. Traffic models considered traffic growth rates into the future.
- Future background growth assumptions are based on the latest land use information available. Any potential effects of COVID-19 on future population growth and employment are not reflected in the modelling results.
- Any upstream or downstream congestion outside the model study area on Milperra Road and Henry Lawson Drive were not considered.

### 2.3.1 Traffic monitoring and existing data

The development of the Existing model for the proposal was validated and calibrated against several key data inputs as presented in Table 2-1.

Table 2-1: Road Network Datasets

| Data type | Source | Application |
| :--- | :--- | :--- |
| Existing model | Transport / Aurecon - Existing model for <br> Henry Lawson Drive Stage 1A | Existing model from Stage 1A extended to <br> include Stage 1B study area. |
| Aerial imagery | Open Street Maps, 2019 Nearmap Imagery | Model network coding, geometry verification |
| Road Classification, <br> Speed Limit Data | Desktop review | Model network coding |
| Traffic Survey Counts | Transport provided survey data (Matrix) for <br> 19 intersections and five midblock locations | Traffic survey counts is used for the purpose <br> of model calibration. |
| SCATS traffic count <br> and Signal Data | Transport - Count data for eight <br> intersections and SCATS IDM signal data <br> (phase splits / times and cycle times | Signal coding and model development |
| Travel Time Survey <br> Data | HERE data provided by Transport. | Used for the purpose of model validation |
| Public transport <br> operations | Bus stops, route information data and <br> timetable data were obtained from Transport | Coding of bus routes in the Existing model |

| Data type | Source | Application |
| :--- | :--- | :--- |
| Zoning and Traffic <br> demands | Transport Model | Zoning and prior traffic demands from <br> provided model have been retained. |
| Strategic Travel Model | Transport Model | Future demand projection |

### 2.3.2 Development of the base case traffic model

This section presents a summary of the development of the base case traffic model. A full breakdown of the development process is provided in the Calibration and Validation Report, which has been included as Appendix A of this report.

The base case traffic model for the proposal was developed using AIMSUN v20.0.3 to replicate 2022 base year traffic conditions for the two-hour weekday AM peak (7:45AM - 9:45AM), weekday PM peak period ( $3: 30 \mathrm{PM}-5: 30 \mathrm{PM}$ ) and weekend (Saturday) peak period (11:30AM - 1:30PM). This involved developing an AIMSUN network model to match existing lane configurations, intersections, gradients, lane/ turn restrictions, turn lanes and reduced speed areas within the study area.

The Traffic Modelling Guideline, Version 1 (Roads and Maritime, 2013) was used as the main guideline for the base year model development, calibration and validation process. The calibration of the base model involved network verification, demand calibration and route choice calibration. This included development of accurate origin-destination (O-D) matrices calibrated against the intersection turn count data, origin destination data, aerial imagery and other background data collected for the proposal. The model was then validated against HERE travel time data, which confirmed the accuracy of the model. HERE data comprises of the aggregation of multiple data sources such as connected vehicle probes, roadway sensors and live operations centres, which yields real-time traffic data such as speed of travel and travel times along individual segments of a roadway.

The calibration and validation process determined that:

- AM, PM and weekend models satisfy the network wide tolerance limits specified by the Traffic Modelling Guidelines with the majority of light and heavy vehicle turning movements. Tolerance was measured by the GEH statistic, a chi-squared test measuring the variance in differences between surveyed and modelled turning movements. The AM, PM and weekend models all achieved GEH values $<5$ for more than $85 \%$ of all turn flows, and GEH values of < 10 for all turn flows. This was achieved during all peak hours for both light and heavy vehicles. Furthermore, a high level of calibration was reinforced through $\mathrm{R}^{2}$ (coefficient of determination) values of 0.99 being consistently achieved during all modelled peak hours for light vehicles, and $R^{2}$ values ranging between 0.87 and 0.94 for heavy vehicles.
- Modelled travel times, specifically in the critical direction (westbound), were within the acceptable 15 per cent tolerance band.
- Model stability is consistent across the 5 chosen seed runs.
- Base case model provides a realistic replication of the study area's traffic operations.

As a result, the base case model has been calibrated and validated to achieve an acceptable representation of the existing road network conditions in accordance with the Traffic Modelling Guideline (Roads and Maritime, 2013) and has been considered fit for purpose for use in the assessment of future year scenarios. The base case scenario is identified as the 2022 existing traffic environment.

### 2.3.3 Development of assessment scenarios for the proposal

This section presents a summary of the future demand estimation process and development of the future 'with proposal' scenario traffic model. A full breakdown of the process is provided in the Future 'with proposal' scenario Report, which has been included as Appendix B of this report.

Future year models were developed for the proposal for the following assessment scenarios:

- 2031 AM/ PM/ Weekend peak period without works ('without proposal')
- 2031 AM/ PM/ Weekend peak period with the proposal ('with proposal')
- 2041 AM/ PM/ Weekend peak period without works ('without proposal')
- 2041 AM/ PM/ Weekend peak period with the proposal ('with proposal')

The future year models for 2031 (opening year) and 2041 (ten years after opening) were developed for the future AM, PM and weekend peaks by adding the predicted traffic growth to the Existing 2022 calibrated demand volumes. The traffic growth was derived using traffic volumes from the Sydney Strategic Traffic Forecasting Model (STFM). The traffic demands used for the future year models have been developed from the 2021, 2031 and 2041 STFM sub-area matrices and link volume plots provided by Transport on $10^{\text {th }}$ May 2022.

It is noted that at the time of modelling, there were several key developments not included within the future land use assumptions within Land Use 2016. Land Use 2016 aligns with the 2016 Census, 2016 NSW Government Population projections and 2014 Metropolitan Strategy 'A Plan for Growing Sydney'. Changes since 2016 include Bankstown Airport redevelopment and Riverlands Golf Course Subdivision. Traffic generated by these developments have been based on the Bankstown Airport Masterplan and the Riverland's Golf Course Residential Subdivision Traffic Impact Assessment (TTPP, 2020) respectively and considered in future traffic volumes.

In addition, the Georges Hall Pinch Point upgrade construction has started north of the proposal on Henry Lawson Drive between Beale Street and Rabaul Road, has been considered in all future year assessment scenarios. The changed traffic movements and improvements to the traffic on Henry Lawson Drive from that project has been modelled in these scenarios.

Table 2-2 summarises the two scenarios that were developed and reported as part of this assessment.

Table 2-2: Future scenarios modelled

| Scenario | Year | Road Network |
| :---: | :---: | :---: |
| Without proposal | 2031 and 2041 | Committed projects <br> - Georges Hall Intersections Upgrade <br> - Henry Lawson Drive/ Tower Road intersection upgrade <br> - Henry Lawson Drive/ Keys Parade intersection upgrade <br> - Milperra Road/ Murray Jones Drive intersection upgrade <br> - Henry Lawson Drive Stage 1A upgrade <br> - Milperra Road and Newbridge intersection upgrade |
| With proposal | 2031 and 2041 | Committed projects <br> - Georges Hall Intersections Upgrade <br> - Henry Lawson Drive/ Tower Road intersection upgrade <br> - Henry Lawson Drive/ Keys Parade intersection upgrade <br> - Milperra Road/ Murray Jones Drive intersection upgrade <br> - Henry Lawson Drive Stage 1A upgrade <br> - Widening to four lanes between Tower Road and Keys Parade <br> - Milperra Road and Newbridge intersection upgrade <br> - Auld Avenue intersection upgrade <br> - Henry Lawson Drive Stage 1B upgrade |

| Scenario | Year | Road Network |
| :---: | :---: | :---: |
|  |  | - Widening to four lanes between Keys Parade and approach of M5 motorway <br> - Henry Lawson Drive/ Keys Parade intersection upgrade <br> - Henry Lawson Drive/ Bullecourt Avenue intersection upgrade <br> - Henry Lawson Drive/ Pozieres Avenue intersection upgrade <br> Link road between Auld Avenue and Keys Parade <br> Raleigh Road extension to Keys Parade |

### 2.4 Traffic performance criteria

### 2.4.1 Level of service criteria for intersections

Intersection operational performance is evaluated by assessing the intersection turning volumes, vehicle delays and level of service (LOS). LOS is a measure used to determine the effectiveness of intersection operation and is commonly used to analyse intersections by categorising traffic flow conditions. For a signalised intersection, the LOS criteria are related to the average intersection delay measured in seconds per vehicle. Table 2-3 below shows the Transport standard LOS criteria for intersection operation.

Table 2-3: Level of Service criteria for intersections

| Level <br> of <br> Service | Average Delay per Vehicle <br> (s/veh) | Traffic Signals, Roundabout |
| :---: | :---: | :--- |
| A | $<14$ | Good operation |
| B | 15 to 28 | Good with acceptable delays \& spare capacity |
| C | 29 to 42 | Satisfactory |
| D | 43 to 56 | Operating near capacity |
| E | 57 to 70 | At capacity; at signals, incidents would cause excessive delays Roundabouts <br> requires other control mode |
| F | $>70$ | Unsatisfactory with excessive queuing |

## 3 Existing conditions

### 3.1 Study area characteristics

### 3.1.1 Surrounding land uses

The study area is located within the City of Canterbury-Bankstown local government area (LGA), though it is noted that a minor part of the area encompassing Newbridge Road extends into the Liverpool LGA. Local development within the City of Canterbury-Bankstown LGA is governed by the Bankstown Local Environmental Plan 2015 (Bankstown LEP), which establishes land zonings that control the types of land uses that are permitted.

Figure 3-1 shows the existing land zoning within Stage 1B study area.

Figure 3-1: Land Zoning

### 3.1.2 Travel behaviour

Table 3-1 provides a summary of the vehicle ownership and Table 3-2 provides a list of other transport methods used in the City of Canterbury-Bankstown and Liverpool LGAs.

In 2021, vehicle ownership in the broader study area ranged between 1.8 - 2 vehicles per household, with 71 per cent of households having two or more motor vehicles. In comparison, 45 per cent of households in City of Canterbury Bankstown LGA and 46 per cent in Greater Sydney households had access to two or more motor vehicles. Only 4.8 per cent of households in the broader study area had no motor vehicles registered.

Table 3-1: Vehicle ownership in 2021

| Indicator | Broader study <br> area |  | Canterbury-Bankstown <br> LGA |  | Greater <br> Sydney |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Number | $\%$ | Number | $\%$ | Number | $\%$ |
| Dwellings with no vehicles | 684 | 4.8 | 13,355 | 11.4 | 203,081 | 11.1 |
| Dwellings with access to two or more motor <br> vehicles | - | 71 | - | 45 | - | 46 |
| Average motor vehicles per dwelling | 2 | - | 1.7 | - | 1.7 | - |

| Bus | 64 | $0.4 \%$ | 1,035 | $1.0 \%$ | 28,786 | $1.4 \%$ |
| Ferry | 4 | $0.0 \%$ | 3 | $0.0 \%$ | 954 | $0.0 \%$ |
| Tram/light rail | 0 | $0.0 \%$ | 17 | $0.0 \%$ | 1,243 | $0.1 \%$ |
| Taxi/ride-share service | 27 | $0.2 \%$ | 223 | $0.2 \%$ | 3,367 | $0.2 \%$ |
| Car, as driver | 7,050 | $48.8 \%$ | 48,383 | $45.9 \%$ | $8,32,277$ | $40.9 \%$ |
| Car, as passenger | 507 | $3.5 \%$ | 4,153 | $3.9 \%$ | 63,954 | $3.1 \%$ |
| Truck | 155 | $1.1 \%$ | 786 | $0.7 \%$ | 14,203 | $0.7 \%$ |
| Motorbike/scooter | 37 | $0.3 \%$ | 426 | $0.4 \%$ | 9,757 | $0.5 \%$ |
| Bicycle | 32 | $0.2 \%$ | 265 | $0.3 \%$ | 8,990 | $0.4 \%$ |
| Other | 94 | $0.7 \%$ | 753 | $0.7 \%$ | 11,358 | $0.6 \%$ |
| Walked only(b) | 170 | $1.2 \%$ | 2,027 | $1.9 \%$ | 56,206 | $2.8 \%$ |
| Worked at home | 6,047 | $41.9 \%$ | 43,131 | $40.9 \%$ | $9,44,501$ | $46.4 \%$ |
| Source: Census of Population and Housing (ABS 2021 ) |  |  |  |  |  |  |

The following travel patterns were identified from the review of ABS data:

- There is a higher proportion of residents in City of Canterbury Bankstown LGA who commute to work by public transport (train, bus, ferry, tram/light rail) when compared to Greater Sydney.
- The preferred method of travel to work in the broader study area, City of Canterbury Bankstown LGA and Greater Sydney was travel to work by car (as driver) and (as passenger). The high vehicle ownership in the broader study area may be reflective of the levels of advantage or disadvantage in the local community, the reliance on private motor vehicles to travel to work, and lack of public transport or active transport mode choice for residents.
- Travel to work by train was the third most used method of travel to work in the broader study area, City of Canterbury Bankstown LGA and Greater Sydney.

### 3.2 Road network

### 3.2.1 Road hierarchy

There are three key road categories in NSW:

- State roads, which form the primary routes for the movement of people and goods within and between major urban centres and include roads classified as Freeways, State Highways and Main Roads under the Roads Act 1993. State Roads are managed by Transport
- Regional roads, which provide for travel between smaller towns and districts as well as perform a subarterial function within major urban centres. These roads are managed by local councils but often receive funding from the State Government due to their importance to the road network in NSW
- Local roads, which include collector and local access roads and are managed by local councils.

The study area for the traffic and transport assessment includes several key roads, which are described in the sections below, including:

- State roads - Milperra Road, Henry Lawson Drive, Newbridge Road, M5 South-West Motorway
- Regional roads - Haig Avenue, Ashford Avenue, Bullecourt Avenue
- Local roads - Tower Road, Rabaul Road, Auld Avenue, Raleigh Road, Ruthven Avenue, Whittle Avenue, Amiens Avenue, Ganmain Crescent, Fromelles Avenue, Hermies Avenue, Pozieres Avenue.

### 3.2.2 Key roads within the study area

## Milperra Road

Milperra Road is a State road that runs predominantly east-west from Newbridge Road in Milperra to Canterbury Road in Revesby. It is part of the A34 arterial route which connects Newtown and Liverpool.

Within the study area, Milperra Road intersects with Newbridge Road and Henry Lawson Drive at an atgrade signalised intersection. This section of Milperra Road has three lanes in each direction, with additional auxiliary turning lanes. It is signposted at 70 kilometres per hour.

In 2022, Milperra Road was estimated to carry about 30,300 vehicles per day in both directions combined.

## Henry Lawson Drive

Henry Lawson Drive is a 20 -kilometre-long State road that runs predominantly north-south from Hume Highway in Villawood to Forest Road in Peakhurst.

Within the study area, Henry Lawson Drive intersects with Bullecourt Avenue at an at-grade signalised intersection. North of this intersection, Henry Lawson Drive has one-lane in each direction, with additional auxiliary turning lanes. South of this intersection, it has one lane in each direction until Pozieres Avenue, where it increases to two lanes in each direction. Both sections are signposted at 60 kilometres per hour.
In 2022, Henry Lawson Drive (between the M5 Motorway and Bullecourt Avenue) was estimated to carry about 27,300 vehicles per day in both directions combined.

## Newbridge Road

Newbridge Road is a State road that runs predominantly east-west from Milperra Road in Milperra to Terminus Road/Hume Highway in Liverpool. It is part of the A34 arterial route which connects Newtown and Liverpool.

Within the study area, Newbridge Road intersects with Milperra Road and Henry Lawson Drive at an atgrade signalised intersection. This section of Milperra Road has three lanes in each direction, with additional auxiliary turning lanes. It is sign posted at 70 kilometres per hour.

In 2022, Newbridge Road was estimated to carry about 42,600 vehicles per day in both directions combined.

## M5 South-West Motorway

The M5 Motorway is a 29-kilometre-long motorway and is the primary route from Liverpool to the Sydney CBD. It intersects with Henry Lawson Drive at a grade separated interchange, within the study area.
In 2022, the M5 South-West Motorway was estimated to carry approximately 86,100 vehicles per day in both directions combined on the mainline.

## Other key roads within the study area

Table 3-3 describes the other key roads within the study area.
Table 3-3: Description of key roads within the study area

| Road | $\quad$ Description |
| :--- | :--- |
| Haig Avenue | Haig Avenue is an east-west regional road that connects Henry Lawson Drive to Georges <br> Crescent/Birdwood Road. It is generally a two-lane undivided road with residences and on-street <br> parking on both sides. |
| Ashford <br> Avenue | Ashford Avenue is a north-south regional road that connects Milperra Road to the Western Sydney <br> University Bankstown campus and residential areas to the south. It is generally a two-lane <br> undivided road with residential and on street parking on both sides. |
| Bullecourt <br> Avenue | Bullecourt Avenue is an east- west regional road that connects Henry Lawson Drive to the <br> Western Sydney University Bankstown campus, residential areas and industrial areas to the east. <br> It is generally a two-lane undivided road with residential and on street parking on both sides. |
| Tower Road | Tower Road is a north-south local road that connects Henry Lawson Drive to Link Road and <br> Bankstown Airport. It is generally a two-lane undivided road with aeronautical industry/golf course <br> on both sides. |
| Auld Avenue | Auld Avenue is an east-west no through local road that connects Henry Lawson Drive to playing <br> fields and cricket pitches to the west. It is generally a two-lane undivided road with on-street <br> parking on both sides. |
| Raleigh Road | Raleigh Road is a north-south local road that connects Henry Lawson Drive to Prescot Parade. It <br> is generally a two-lane undivided road with residences and on-street parking on both sides. |
| Ruthven | Ruthven Avenue is an east-west local road that connects Henry Lawson Drive residential areas <br> and ends in a cul-de-sac. It is generally a two-lane undivided road with residences and on-street <br> parking on both sides. |
| Avenue | Whittle Avenue is an east-west local road that connects Henry Lawson Drive to Keysor Place. It is <br> generally a two-lane undivided road with residences and on-street parking on both sides. |
| Whittle Avenue |  |

### 3.2.3 Key intersections within the study area

Table 3-4 summarises the existing key intersections and key features of the intersections.
Table 3-4: Summary of key intersections within the study area

| Intersection | Image | Layout |
| :---: | :---: | :---: |
| Henry Lawson Drive / Bullecourt Avenue |  | - Signalised T-Intersection. <br> - Access to Bullecourt Avenue from Henry Lawson Drive northbound carriageway via right turn short lane. Access from southbound carriageway via a left full-length lane. <br> - Access from Bullecourt Avenue to Henry Lawson Drive via full length (100m) dedicated left and right turn lanes. |
| Henry Lawson Drive / Pozieres Avenue |  | - Signalised T-Intersection. <br> - Access to Pozieres Avenue from Henry Lawson Drive northbound carriageway via through-left full-length lane. Access from southbound carriageway via a through-right fulllength lane. <br> - Access from Pozieres Avenue to Henry Lawson Drive via full length ( 50 m ) dedicated left and right turn lanes. |
| Henry Lawson Drive / Raleigh Road |  | - Priority T-intersection with one lane approach / exit on eastbound (Raleigh Road). Henry Lawson Drive northbound approach with a through full length lane and left turn short lane, and two exit lanes merging to one after 35m. Henry Lawson Drive southbound approach with a through full length lane and right turn short lane, and a one lane exit. <br> - All turning movements permitted. Raleigh Road westbound onto Henry Lawson Drive controlled by Give Way sign. |

- Priority T-intersection with one lane approach / exit on westbound (Hermies Avenue). Henry Lawson Drive northbound approach with a through full length lane and shared through-right turn full length lane, and two exit lanes. Henry Lawson Drive southbound approach with a throughleft full length lane and two lane exit.
- All turning movements permitted. Hermies Avenue westbound onto Henry Lawson Drive controlled by Give Way sign.
- Signalised T-Intersection. At the time of the assessment, Transport acknowledges that the airport redevelopment has removed the roundabout shown in the aerial 30 m east of the intersection.

Henry Lawson Drive / Tower Road

- Access to Tower Road from Henry Lawson Drive northbound carriageway via right turn short lane. Access from southbound carriageway via a throughleft full-length lane.
- Access from Tower Road to Henry Lawson Drive via full length (30m) dedicated left and right turn lanes.
- Noted that this would be upgraded as part of Stage 1A upgrades.

- Signalised four-way intersection with all turning movements permitted.
- Left turns on all approaches are single slip lanes protected by median islands. Two left turn slip lanes are provided on the southern approach of Henry Lawson Drive.
- Right turns on all approaches are on single dedicated right turn short lanes. Two right turn lanes are provided on Henry Lawson Drive southbound.
- Noted that this would be upgraded as part of Stage 1A upgrades.

- Priority T-intersection with one lane approach / exit on all legs, except for Henry Lawson Drive northbound exit lane expanding to two lanes after the intersection.
- All turning movements permitted. Auld Avenue eastbound onto Henry Lawson Drive controlled by Give Way sign.
- Noted that this would be upgraded as part of Stage 1A upgrades.

- Signalised T intersection for access to/ from Flower Power and Henry Lawson Drive
- Access to Flower Power from Henry Lawson Drive northbound carriageway via a right turn short lane. Access from southbound carriageway via a protected short left turn slip lane, with left turn permitted on red.
- Access from Flower Power to Henry Lawson Drive northbound via dedicated right turn lane. Access to southbound carriageway via a protected left turn slip lane.
- Note that the western leg would be constructed by the Riverlands developer prior to the proposal being constructed.

## Henry Lawson Drive / Haig Avenue

## - Signalised T-Intersection

- Access to Haig Avenue from Henry Lawson Drive northbound and southbound via right and left turn short lanes respectively.
- Access from Haig Avenue to Henry Lawson Drive southbound carriageway via left-turn short lane. Access to northbound carriageway via right turn full length lane.

### 3.2.4 Simulated traffic flow from the base model

The process of model calibration and validation is a highly iterative process which involves network verification and fine-adjustment of both appropriate model parameters and the origin-destination matrices. The aim of this process is to improve the ability of the model to reproduce observed vehicle / driver behaviour and the match between modelled and observed traffic movements.

Figure 3-2, Figure 3-3 and Figure 3-4 present simulated traffic flow from the 2022 base model in AM, PM and weekend peak hours respectively.

Figure 3-2: Simulated traffic flow in 2022 AM peak hour

Figure 3-3: Simulated traffic flow in 2022 PM peak hour

Figure 3-4: Simulated traffic flow in 2022 weekend peak hour

### 3.2.5 Intersection performance

The traffic performance of key intersections within the study area as per the Existing model results for the 2022 peak periods are presented in the following sections. The delays are shown in seconds.

## AM Model Intersection Level of Service

The LOS has been analysed during 07:45-08:45 AM and 08:45-09:45 AM respectively, at 15 key intersections. Table 3-5 presents a LOS summary of these 15 key intersections during the weekday AM Peak period.

Table 3-5: AM Peak Intersection Level of Service Summary

| ID | Intersection | $07: 45-08: 45$ AM |  |  | $08: 45-09: 45$ AM |  |  |
| :---: | :--- | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Intersection |  | Intersection |  |  |  |
|  |  | Volume | Delay (s) | LOS | Volume | Delay (s) | LOS |
| 1 | HLD / Haig Avenue | 2,404 | 33 | C | 2,142 | 34 | C |
| 2 | HLD / Tower Road | 2,833 | 26 | B | 2,601 | 55 | D |
| 3 | HLD / Milperra Road | 5,771 | 228 | F | 5,556 | 591 | F |
| 4 | HLD / Auld Avenue | 2,101 | 6 | A | 1,975 | 6 | A |
| 5 | HLD / Keys Parade | 1,995 | 12 | A | 1,992 | 16 | B |
| 6 | HLD / Raleigh Road | 1,985 | 5 | A | 1,742 | 5 | A |
| 7 | HLD / Ruthven Avenue | 1,867 | 3 | A | 1,655 | 3 | A |

| ID | Intersection | $07: 45-08: 45$ AM |  |  | $08: 45-09: 45$ AM |  |  |
| ---: | :--- | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Intersection |  |  | Intersection |  |  |
|  |  | Volume | Delay (s) | LOS | Volume | Delay (s) | LOS |
| 8 | HLD / Whittle Avenue | 1,880 | 3 | A | 1,647 | 3 | A |
| 9 | HLD / Amiens Avenue | 1,919 | 4 | A | 1,694 | 3 | A |
| 10 | HLD / Bullecourt Avenue | 2,298 | 25 | B | 2,030 | 25 | B |
| 11 | HLD / Fromelles Avenue | 2,018 | 8 | A | 1,726 | 7 | A |
| 12 | HL / Hermies Avenue | 2,043 | 4 | A | 1,757 | 3 | A |
| 13 | HLD / Pozieres Avenue | 2,279 | 17 | B | 2,004 | 17 | B |
| 14 | Murray Jones Drive / Milperra Road | 2,976 | 4 | A | 2,883 | 19 | B |
| 15 | Ashford Avenue / Milperra Road | 3,382 | 35 | C | 3,282 | 52 | D |

Analysis of the three key intersections within the proposal area shows that at:

- Henry Lawson Drive / Keys Parade:
- In the first AM peak hour, the intersection operates at LOS A with an intersection delay of 12 seconds, and in the second peak hour, at LOS B with an intersection delay of 16 seconds indicating an overall good level of service.
- Henry Lawson Drive / Bullecourt Avenue:
- During the whole AM peak period, the intersection operates at LOS B with intersection delay of 25 seconds in both peak hours, indicating good level of performance. The traffic demand on northbound, southbound, and eastbound (turning into Bullecourt Avenue) is high which creates a small and short-lasting queue at each approach of the intersection. The model suggests that the queues on all approaches mostly get dissipated during green time for that approach. The users going northbound onto Henry Lawson Drive from Bullecourt Avenue face the most delay. The existing delay on Bullecourt Avenue is 68 seconds.
- Henry Lawson Drive / Pozieres Avenue:
- During AM peak period, the intersection operates at LOS B with intersection delay of 17 seconds in both hours. The model suggests the users turning from Pozieres Avenue into Henry Lawson Drive may face some delay. The delay for users from Pozieres Avenue is 68 seconds.

## PM Model Intersection Level of Service

The LOS has been analysed during 3:30-4:30 PM and 4:30-5:30 PM respectively, at 15 key intersections. Table 3-6 presents a LOS summary of these 15 key intersections during the weekday PM Peak period.

Table 3-6: PM Peak Intersection Level of Service Summary

| ID | Intersection | $3: 30-4: 30$ PM |  |  | $4: 30-5: 30$ PM |  |  |
| ---: | :--- | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Intersection |  |  | Intersection |  |  |
|  |  | Volume | Delay (s) | LOS | Volume | Delay (s) | LOS |
| 1 | HLD / Haig Avenue | 2,408 | 55 | D | 2,476 | 57 | E |
| 2 | HLD / Tower Road | 2,976 | 35 | C | 3,135 | 37 | C |
| 3 | HLD / Milperra Road | 6,545 | 237 | F | 6,871 | 469 | F |
| 4 | HLD / Auld Avenue | 2,221 | 7 | A | 2,363 | 8 | A |
| 5 | HLD / Keys Parade | 2,209 | 14 | A | 2,358 | 17 | B |
| 6 | HLD / Raleigh Road | 2,033 | 5 | A | 2,052 | 5 | A |
| 7 | HLD / Ruthven Avenue | 1,939 | 3 | A | 1,930 | 3 | A |
| 8 | HLD / Whittle Avenue | 1,959 | 3 | A | 1,943 | 3 | A |
| 9 | HLD / Amiens Avenue | 2,015 | 3 | A | 1,989 | 3 | A |
| 10 | HLD / Bullecourt Avenue | 2,355 | 45 | D | 2,342 | 38 | C |
| 11 | HLD / Fromelles Avenue | 1,972 | 6 | A | 1,982 | 5 | A |
| 12 | HL / Hermies Avenue | 2,109 | 5 | A | 2,087 | 4 | A |

| ID | Intersection | $3: 30-4: 30$ PM |  |  | $4: 30-5: 30$ PM |  |  |
| :---: | :--- | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Intersection |  |  | Intersection |  |  |
|  |  | Volume | Delay (s) | LOS | Volume | Delay (s) | LOS |
| 13 | HLD / Pozieres Avenue | 2,272 | 12 | A | 2,253 | 11 | A |
| 14 | Murray Jones Drive / Milperra Road | 3,578 | 6 | A | 3,342 | 16 | B |
| 15 | Ashford Avenue / Milperra Road | 4,019 | 18 | B | 3,698 | 20 | B |

Analysis of the three key intersections within the Stage 1B study area shows that at:

- Henry Lawson Drive / Keys Parade:
- During the first PM peak hour, the intersection operates at LOS A with an intersection delay of 14 seconds and in the second peak hour, operates at LOS B with an intersection delay of 17 seconds indicating a good level of service.
- During the PM peak period, the demand for traffic turning from Henry Lawson Drive into Flower Power and demand for traffic turning from Flower Power onto Henry Lawson Drive is higher. Also, the demand on Henry Lawson Drive northbound and southbound is high. The delay for Flower Power in the first peak hour is 44 seconds and for the second peak hour is 43 seconds.
- Henry Lawson Drive / Bullecourt Avenue:

During the first PM peak hour, the intersection operates at LOS D with an intersection delay of 45 seconds and in the second peak hour, the intersection operates at an improved LOS C with an intersection delay of 38 seconds.

In the PM peak period, the demand from Bullecourt Avenue turning onto Henry Lawson Drive increases considerably resulting in congestion on the approach. The average delay on Bullecourt Avenue in the first peak hour is 112 seconds and in the second peak hour, 92 seconds. The high delay on Bullecourt Avenue approach leads to comparatively higher overall intersection delay and hence an overall LOS D.

- Henry Lawson Drive / Pozieres Avenue:
- During the PM peak period, the intersection operates at LOS A indicating a good level of performance. The model suggests the users turning from Pozieres Avenue into Henry Lawson Drive may face delays of 51 seconds.

## Weekend Model Intersection Level of Service

The LOS has been analysed during 11:30 AM - 12:30 PM and 12:30 PM - 01:30 PM respectively, at 15 key intersections. Table 3-7 presents a LOS summary of these 15 key intersections during the weekend peak period.

Table 3-7: Weekend Peak Intersection Level of Service Summary

| ID | Intersection | $11: 30$ AM - 12:30 PM |  |  | $12: 30$ PM - 01:30 PM |  |  |
| ---: | :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Intersection |  |  | Intersection |  |  |
|  |  | Volume | Delay (s) | LOS | Volume | Delay (s) | LOS |
| 1 | HLD / Haig Avenue | 2,339 | 32 | C | 2,407 | 34 | C |
| 2 | HLD / Tower Road | 2,779 | 22 | B | 2,880 | 25 | B |
| 3 | HLD / Milperra Road | 5,964 | 55 | D | 5,858 | 102 | F |
| 4 | HLD / Auld Avenue | 2,250 | 6 | A | 1,997 | 5 | A |
| 5 | HLD / Keys Parade | 2,303 | 17 | B | 2,075 | 17 | B |
| 6 | HLD / Raleigh Road | 1,706 | 3 | A | 1,532 | 3 | A |
| 7 | HLD / Ruthven Avenue | 1,589 | 3 | A | 1,445 | 2 | A |
| 8 | HLD / Whittle Avenue | 1,585 | 3 | A | 1,441 | 3 | A |
| 9 | HLD / Amiens Avenue | 1,613 | 3 | A | 1,468 | 2 | A |
| 10 | HLD / Bullecourt Avenue | 1,792 | 24 | B | 1,601 | 23 | B |
| 11 | HLD / Fromelles Avenue | 1,673 | 5 | A | 1,625 | 5 | A |

| ID | Intersection | $11: 30$ AM - 12:30 PM |  |  | $12: 30$ PM - 01:30 PM |  |  |
| :---: | :--- | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Intersection |  | Intersection |  |  |  |
|  |  | Volume | Delay (s) | LOS | Volume | Delay (s) | LOS |
| 12 | HL / Hermies Avenue | 1,931 | 4 | A | 1,785 | 4 | A |
| 13 | HLD / Pozieres Avenue | 2,111 | 13 | A | 1,949 | 12 | A |
| 14 | Murray Jones Drive / Milperra Road | 3,179 | 3 | A | 3,128 | 4 | A |
| 15 | Ashford Avenue / Milperra Road | 3,482 | 23 | B | 3,449 | 52 | D |

Analysis of the three key intersections within the proposal area shows that at:

- Henry Lawson Drive / Keys Parade/ Flower power:
- In the first weekend peak hour from 11:30 AM - 12:30 PM, the intersection operates at LOS B with an intersection delay of 17 seconds, and in the second peak hour from 12:30 PM-01:30 PM, the intersection operates at LOS B with an intersection delay of 17 seconds indicating a good level of service.
- Henry Lawson Drive / Bullecourt Avenue:
- During the weekend peak period from 11:30 AM-01:30 PM, the intersection operates at LOS B in both peak hours, indicating a good level of performance. The traffic going northbound, southbound, and eastbound (turning into Bullecourt Avenue) creates a small and short-lasting queue at each approach of the intersection. The model suggests that the queues on all approaches mostly get dissipated during green time for that approach. The users going northbound to Henry Lawson Drive from Bullecourt Avenue in the east approach face the most delay. The existing delay on Bullecourt Avenue (east approach is) is 61 seconds.
- Henry Lawson Drive / Pozieres Avenue:
- During weekend peak period, the intersection operates at LOS A in both hours. The model suggests the users turning from Pozieres Avenue into Henry Lawson Drive may face some delay. The delay for users from Pozieres Avenue is 59 seconds.

### 3.2.6 Freight

## Heavy vehicle numbers

Most of the Sydney's freight is conveyed by road. Henry Lawson Drive is an important route for freight and industrial type business operations that connects surrounding large industrial areas of Milperra, Revesby, Chipping Norton and Moorebank, which are made up of warehouses, manufacturing, storage and logistics businesses. As a result, a range of vehicles including heavy vehicles travel throughout the local road network. Table 3-8 shows the estimated heavy vehicle volumes along different sections of Henry Lawson Drive for a typical weekday for the AM, PM and weekend peaks, based on estimations from several traffic survey data sources for 2022.

It is noted that the modelled demand of heavy vehicles along Henry Lawson Drive during the AM and PM peak periods is lower than the traffic volumes reported in Table 3-8. This is due to congestion at the Milperra Road / Henry Lawson Drive intersection, which limits traffic entering Henry Lawson Drive from Milperra Road in both the northbound and southbound directions during the model simulation period. The number of vehicles, including heavy vehicles, that were unable to enter the network due to queues extending beyond the Milperra Road area are up to 883 vehicles (around 97 heavy vehicles) in the weekday AM peak period and up to 1,454 vehicles (around 117 heavy vehicles) in the weekday PM peak period. However, this issue does not exist in the weekend model and as a result, the heavy vehicle volumes during weekend appears to be similar or higher than the weekday AM and PM peak period.

The proportion of heavy vehicles during the peak periods along Henry Lawson Drive is high compared to the average of $4 \%$ across the Sydney Urban Network.

Table 3-8: Average Weekday Estimated Peak Period Heavy Vehicle Volumes - Combined Directions

| Midblock | $7: 45$ AM-9:45 AM |  | $3: 30$ PM-5:30 PM |  | $11: 30$ AM-1:30 PM |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Vol | $\%$ | Vol | $\%$ | Vol | $\%$ |
| Henry Lawson Drive between Haig Avenue <br> and Milperra Road | 632 | $13 \%$ | 393 | $8 \%$ | 369 | $11 \%$ |
| Henry Lawson Drive between Milperra Road <br> and Bullecourt Avenue | 516 | $13 \%$ | 342 | $8 \%$ | 341 | $12 \%$ |
| Henry Lawson Drive between Bullecourt <br> Avenue and the M5 Motorway | 632 | $16 \%$ | 412 | $10 \%$ | 441 | $14 \%$ |

## Access and routes

Figure 3-5 shows the approved B-Double routes for vehicles up to 26 metres in length on the road network surrounding the study area, based on the Transport Restricted Access Vehicles map. These are shown in green.

This shows that the study area is well serviced by roads suitable for heavy vehicles, including Henry Lawson Drive, Newbridge Road, Milperra Road, Ashford Avenue and the M5 Motorway.

-19m B-double Routes (over 50 tonnes)
-23m B-double Routes
-25/26m B-double Routes
Figure 3-5: B-Double Routes

### 3.2.7 Crash data analysis

The crash data for the past seven years (2015 to 2021) was received from Transport for Henry Lawson Drive across the study area. The crash map for the study area is shown in Figure 3-8.

The crash history is summarised in Figure 3-6 along with the crash types shown in Figure 3-7. Note that casualty crashes include accidents involving fatalities, seriously injury, moderate injury and minor injury.

Figure 3-6: Crash history along Henry Lawson Drive and Milperra Road (2010 - 2019)

Figure 3-7: Crash by type along Henry Lawson Drive and Milperra Road (2010 - 2019)
The crash history data shows an average of 28 crashes and 19 casualties per year within the study area. The rear end crashes make up the majority of crashes ( 37 percent) followed by crashes involving an 'other angle' first impact between two vehicles (i.e., not a head-on, right angle or rear end impact), which accounts for 31 percent. Most crashes occur within 10 metres of the intersection ( 50 percent).

It is noted that COVID-19 years (2020 and 2021) accounts for a smaller number of incidents in comparison to previous years.

Figure 3-8: Crash Cordon

In addition, overall crash data for the Canterbury-Bankstown LGA (as a proxy for the study area) has been compared to crash data for the Greater Sydney area and NSW. The crash data for the 5-year period 2017 to 2021 for these areas were available from Transport's Centre for Road Safety's Interactive crash and casualty statistics. Figure 3-9 to Figure 3-11 presents a comparison of the three areas' crash data for three statistics, namely crashes per year, distribution of crash degree and distribution of crash type.

Figure 3-9 presents the total number of crashes per area per reporting year (period 2017 to 2021). All three areas show a generally consistent decline in the total number of crashes per year from 2017 to 2021. The Canterbury-Bankstown LGA represents a fairly constant $9-10 \%$ of the total crashes in the Greater Sydney area, and $5-6 \%$ of the total crashes in NSW. Therefore, apart from the number of crashes declining annually in the Canterbury-Bankstown LGA over the reporting period, the rate of decline is similar to the Greater Sydney area and NSW.

Figure 3-9: Total crashes per area per reporting year (Source: Transport's Centre for Road Safety)

Figure 3-10 presents the distribution of crash degree per area over the reporting period (2017 to 2021). The Canterbury-Bankstown LGA reflects a similar crash degree distribution than the Greater Sydney area, with the exception of 'minor/other injuries' being slightly higher in the Canterbury-Bankstown LGA. This is however balanced with the Canterbury-Bankstown LGA having slightly less 'moderate injury' and 'noncasualty (towaway)' injuries compared to the Greater Sydney area. Compared to NSW, the CanterburyBankstown LGA had a consistently lower or similar distribution of injury types, apart from 'minor/other injuries' which were higher in the Canterbury-Bankstown LGA.

Figure 3-10: Crash degree distribution per area (Source: Transport's Centre for Road Safety)
Figure 3-11 presents the distribution of crash type per area over the reporting period (2017 to 2021). Compared to both the Greater Sydney area and NSW, the Canterbury-Bankstown LGA experienced a higher
distribution of 'adjacent direction at intersections' crashes, 'other opposing direction' crashes and 'rear end' crashes during the reporting period. Similar to the Greater Sydney area and NSW, the CanterburyBankstown LGA's most likely crash type over the reporting period were 'rear end' crashes, followed by 'off path / out of control (on straight)' crashes, and 'adjacent directions at intersections' crashes.

Figure 3-11: Crash type distribution per area (Source: Transport's Centre for Road Safety)

### 3.3 Public transport

### 3.3.1 Rail network

There is no rail network within the study area. The nearest train stations are East Hills station, about four kilometres to the south, and Liverpool Station, about five kilometres to the west.

### 3.3.2 Bus network

A map of bus routes within the study area has been obtained from Transport for New South Wales website. The study area is serviced by 12 bus routes:

- 922 - Bankstown to East Hills (see Figure 3-12)
- 962 - East Hills to Miranda (see Figure 3-13)
- M90 - Burwood to Liverpool (see Figure 3-14)
- S120 - Beaconsfield Street after Marigold Street, Revesby to Georges River Grammar (see Figure 3-15)
- S129 - WSU Bankstown to Picnic Point High School (see Figure 3-16)
- S162 - WSU Bankstown to Mount St. Joseph Secondary School (see Figure 3-17Figure 3-12)
- S163 - Mount St Joseph Secondary School to East Hills Girls Technology High School (see Figure 3-13)
- S510 - Delfin Drive at Collie Court, Moorebank to East Hills Boys High School (see Figure 3-18)
- S617 - Nuwarra Police Station to De La Salle College (see Figure 3-18)

Figure 3-12: Bus Route 922

Figure 3-15: Bus Route S120

Figure 3-16: Bus Route S129

Figure 3-17: Bus Route S162

Figure 3-18: Bus Routes S510 and S617

### 3.4 Active transport

### 3.4.1 Pedestrian infrastructure

There are existing pedestrian footpaths and shared paths across the proposal area, including existing pathways for pedestrians along:

- Existing shared path along the eastern side of Henry Lawson Drive between M5 and Pozieres Avenue
- A short section of footpath from Ganmain Crescent to the intersection at Pozieres Avenue.
- Sections of footpath along the western side of Henry Lawson Drive that connect the playing fields along Auld Avenue to local roads including Raleigh Road, Borella Road, Ruthven Avenue, Amiens Avenue and Ganmain Crescent.
- A short section of footpath outside Flower Power at the Key Parade intersection.
- Shared paths that run through the reserves and playing fields around Raleigh Road to Auld Avenue.
- Local roads within the residential streets within the proposal area.

The pedestrian infrastructure is shown on Figure 3-19.

### 3.4.2 Cyclist infrastructure

A map of cyclist infrastructure within the study area has been obtained from Transport Cycleway Finder and is provided in Figure 3-19. It shows that Henry Lawson Drive does not have continuous cycling path along the Stage-1B study corridor. There is an existing concrete shared path along the length of Henry Lawson Drive (i) between the M5 Motorway and Pozieres Avenue; (ii) between northern end of Ganmain Crescent and eastern end of Ruthven Avenue; and (iii) between western end of Ruthven Avenue and Keys Parade. The cyclists use residential streets of Ganmain Crescent and Ruthven Avenue to access cycling path.

Figure 3-19: Active Transport Infrastructure

### 3.5 Parking considerations

There is no on-street parking along Henry Lawson Drive. On-street and dedicated parking is available along the local road network. Of note, this includes:

- On-street parking along Bullecourt Avenue between Henry Lawson Drive and Ashford Avenue, providing both for residential and commercial parking. There are no limitations on parking along Bullecourt Avenue.
- On-street parking along Raleigh Road, Ruthven Avenue, Ingram Avenue, Ganmain Crescent and Fromelles Avenue providing parking for local residents. There are no limitations on parking along these local roads.
- Dedicated parking bays on Auld Avenue associated with the playing fields. These are marked car bays with no restrictions.
- Private car park at the Milperra Sports Centre off Raleigh Road.

## 4 Proposal description

### 4.1 Proposal overview

Key features of the proposal would include:

- widening Henry Lawson Drive from two to four lanes between Auld Avenue, Milperra and the M5 Motorway, Milperra with a raised central median
- upgrading the Henry Lawson Drive / Bullecourt Avenue signalised intersection, including:
- an additional right-turn lane from Henry Lawson Drive (northbound) to Bullecourt Avenue (two rightturn lanes total)
- an additional right-turn lane from Bullecourt Avenue to Henry Lawson Drive (northbound) (two rightturn lanes total)
- converting the existing dedicated left-turn lane from Bullecourt Avenue to Henry Lawson Drive (southbound) into a dedicated left-turn slip lane
- maintaining the dedicated left-turn lane from Henry Lawson Drive (southbound) to Bullecourt Avenue
- upgrading the Henry Lawson Drive / Pozieres Avenue signalised intersection, including:
- a new dedicated right-turn lane from Henry Lawson Drive (southbound) to Pozieres Avenue
- a new dedicated left-turn lane from Henry Lawson Drive (northbound) to Pozieres Avenue and relocation of the existing bus stop north of the intersection
- providing a new two-lane local link road between Auld Avenue and Keys Parade (about 160 metres), crossing over Milperra Drain, providing access to / from southbound lanes of Henry Lawson Drive and Auld Avenue, and removing up to eight parking spaces on Auld Avenue to accommodate the link road
extending Raleigh Road about 120 metres to connect with Keys Parade at a roundabout, and removing the direct connection between Raleigh Road and Henry Lawson Drive
converting the Henry Lawson Drive intersections to be left-in left-out only, at:
- Ruthven Avenue
- Whittle Avenue
- Amiens Avenue
- Ganmain Crescent
- Fromelles Avenue
- Hermies Avenue
- modifying the Bullecourt Avenue / Ashford Avenue intersection to better accommodate heavy vehicle movements
- constructing a three-metre-wide shared path:
- on the western side of Henry Lawson Drive between Pozieres Avenue and Keys Parade
- along Keys Parade, the new Auld Avenue local link road and the extended section of Raleigh Road
- reconstruction of some existing shared paths within the proposal area
- constructing a new footpath within the proposal area:
- on the eastern side of Henry Lawson Drive between the Flower Power and Ingram Avenue
- along the northern side of Ingram Avenue
- along the eastern side of Fromelles Avenue
installing new drainage infrastructure and water quality controls within the proposal area, including:
- an upgraded longitudinal and transverse drainage pits and pipes network along Henry Lawson Drive
- a bioretention basin between Henry Lawson Drive, Bullecourt Avenue and Fleurbaix Avenue and maintenance access to this basin
- swales along Henry Lawson Drive and Keys Parade and installation of Gross Pollutant Traps
- construction activities and ancillary work, including:
- relocation of utilities (including electrical, gas, water and telecommunications)
- civil earthworks, drainage work, water quality controls and tie-in work to adjoining sections of Henry Lawson Drive and local roads
- final roadworks including pavement, kerb and gutters, signs, road furniture, landscaping, lighting and line marking
- new traffic signals and intelligent transport systems including, but not limited to, closed-circuit television
- establishment of temporary ancillary facilities to support construction, including compound sites, site offices, stockpile and laydown locations, temporary access tracks and water quality devices.

The concept design would be further refined during detailed design to minimise environmental and social impacts and to consider community feedback to the exhibition of the REF.

### 4.2 Construction

### 4.2.1 Construction overview

Construction activities would be carried out in accordance with a construction environmental management plan (CEMP) to ensure work complies with Transport's commitments and legislative requirements. Detailed work methodologies would be identified by the construction contractor.

The proposal is expected to involve the following activities:

- Preliminary and utility works
- Earthworks
- Widening and pavement works
- Bridge and drainage works
- Pedestrian pathway, intersection crossing, and shared path works
- Intersection configuration and traffic signals
- Landscaping and finishing works
- Removal of ancillary facilities and site rehabilitation.

### 4.2.2 Construction footprint

A construction footprint has been developed for the proposal to cover all works and construction activities. In general, the construction footprint has assumed a five-metre buffer from the edge of design. The footprint also considers ancillary facilities and works areas for equipment and machinery. Where possible, the footprint has been developed to minimise environmental impacts.

### 4.2.3 Site establishment

The construction contractor would potentially establish construction compounds on the various vacant land areas as follows:

- Main office at 437 Henry Lawson Drive (following Stage 1A completion).
- Vacant land on the south western corner of Henry Lawson Drive and Auld Ave.
- Vacant land at 491 Henry Lawson Drive. Subject to flooding assessment.
- Area adjacent to Keys Parade (future). Subject to discussions with the owner.
- Raleigh Reserve.
- The Bullecourt Avenue 'triangle'. Use subject to heritage assessment and final design.
- Vacant land on corner of Bullecourt Avenue and Bullecourt Lane. Subject to discussions with owner.

The construction compounds would be used variously for site offices, change rooms, ablutions, secure storage, laydown and parking. Where practicable, temporary buildings and structures would be used to provide a noise barrier between the construction site and adjacent sensitive receptors. The location of temporary buildings and structures would have regard to overlooking and overshadowing impacts on adjacent sensitive receptors.

### 4.2.4 Construction and traffic staging

Notwithstanding initial setup works, the construction and traffic staging for Henry Lawson Drive Stage 1B is currently proposed to be a two-staged process based on the assumption that major reconstruction of existing pavement is not required.

- Stage 1:
- Construction work on the widening section of Henry Lawson Drive (future northbound lanes)
- Keep two-way traffic flow on existing Henry Lawson Drive adjacent to construction works at a reduced speed limit
- Detours to local road accesses would be required.
- Nightwork would be required from time to time at major intersections

## - Stage 2 :

- Construction work on existing Henry Lawson Drive to correct road levels, install drainage and rehabilitate existing pavement (future southbound lanes)
- Keep two-way traffic flow on newly built Henry Lawson Drive adjacent to construction works at a reduced speed limit
- Detours to local road accesses would be required.
- Nightwork would be required from time to time at major intersections

### 4.2.5 Construction workforce

The number and types of workers would vary throughout the different stages of construction but would include workers such as:

- plant and machinery operators
- traffic controllers
- labourers
- utilities servicers
- project and site managers.

Final details of the workforce would be identified at a later stage by the construction contractor.

### 4.2.6 Traffic management and staging

The indicative construction traffic volumes are provided in Table 4-1 below.
Table 4-1: Estimated construction traffic

| Vehicle type | Total vehicle <br> movements per <br> day | Vehicle movements per <br> day at peak construction <br> period | AM peak <br> movements | PM peak <br> movements |
| :--- | :---: | :---: | :---: | :---: |
| Construction personnel <br> (cars and private <br> vehicles) | 100 | 160 | 96 | 64 |
| Light construction <br> vehicles and utes | 40 | 90 | 54 | 36 |
| Heavy vehicles and <br> trucks | 50 | 72 | 43 | 29 |

During construction of the proposal, traffic management controls and staging would be implemented to maintain safety and reduce impacts on the existing road network. The staging process would be confirmed by the construction contractor in a Traffic Management Plan (TMP) prepared for the proposal.

### 4.2.7 Construction haulage routes

The haulage routes to and from site would generally use existing routes approved for heavy vehicles surrounding the proposal. Haulage within the locality of the proposal area may take several routes including:

- Henry Lawson Drive
- Bullecourt Avenue
- Ashford Avenue
- Pozieres Avenue
- Raleigh Road
- Auld Avenue
- Milperra Road
- Webster Steet, or Bransgrove Road and existing oval area (pending consultation with Council)
- Newbridge Road.

Use of local roads would be minimised, where possible. Final haulage routes would be determined by the construction contractor.

## 5 Impact assessment

### 5.1 Construction impacts

### 5.1.1 Construction traffic impacts

The proposal would generate light and heavy vehicle movements on the road network surrounding the proposal associated with delivery or removal of construction materials and equipment and construction worker movements to and from the construction footprint. The construction traffic for delivery or removal of construction materials and equipment would generally be staged throughout the day. The construction workers would generally arrive and leave site at the start and end of each shift.

The construction footprint is well serviced by roads suitable for heavy vehicles. Therefore, impacts on local roads surrounding the proposal are expected to be limited to short sections of local roads required to access the construction zones. The construction would take 29 months to complete, and impacts are expected for the duration of this period.

In particular, some roads would be used for construction vehicles to turn around such as the roundabout at Bullecourt Avenue and Ashford Avenue or turning around in the carpark off Bransgrove Road.

Overall, while the construction workforce traffic would likely be noticeable, the additional volume of vehicles would be relatively small compared to the existing traffic volumes of vehicles on Henry Lawson Drive. The other local roads near the proposal have sufficient capacity to accommodate construction traffic. Several haulage route options would be available during construction and would enable access to the ancillary facilities and work areas from the north (Hume Highway via Henry Lawson Drive, Milperra Road or Newbridge Road), south (the M5 Motorway) and east (Bullecourt Avenue).

Therefore, any impact on the surrounding road network performance associated with construction traffic from the proposal is expected to be minor to moderate. Construction traffic volumes would be further assessed in the construction staging plan during detailed design.

### 5.1.2 Impacts associated with site access

The construction and all associated works would result in temporary changes in road and property access, as well as pedestrian and cyclist access across the local road network.

## Road access

The construction site would be appropriately fenced, and traffic deflection barriers installed, to avoid public vehicles accidentally accessing the construction site.

While the roads would remain open, there may be a need for temporary lane closures at times during the construction period. In addition, as sections of the upgrade are completed, traffic switches occur to shift traffic onto new sections of the road to enable works on existing pavement to be completed. All impacts to the road network would be undertaken in accordance with a Road Occupancy Licence (ROL) to be obtained from the Transport Management Centre. Access for emergency vehicles would be maintained along project affected roads.

There may be short periods of time where local roads may need to be closed or opened only for residents. These periods would, where possible, be undertaken outside of peak traffic periods, especially on weekends where the playing fields are in use by community sports. In addition, access arrangements would be planned to the south western Milperra road network to ensure access is maintained for local residents. Construction would be staged so access from the local roads to Henry Lawson Drive southbound are not affected concurrently. This would maintain access through the construction period and prior to the opening of the Raleigh Road Key Parade link.

The construction contractor would confirm the need and duration of any road closures in consultation with the community and in accordance with any required Council Road Opening Permit.

## Property access

Access to properties would be maintained during construction, though it may need to be disturbed on a short-term basis. Landowners and occupiers would be consulted by the construction contractor about any potential impacts to access and methods to minimise these impacts. Consultation would be undertaken well in advance of property accesses being impacted.

### 5.1.3 Impacts on parking

While there is no parking on Henry Lawson Drive, there may be temporary disruptions to parking on local roads within the proposal area during construction. Activities which may disrupt local road parking include:

- installation of the footpath on Ingram Avenue and Fromelles Avenue
- work on Auld Avenue, Raleigh Road and Bullecourt Avenue associated with upgrades to these roads
- work adjacent to Ruthven Avenue and Ganmain Crescent associated with the widening of Henry Lawson Drive, installation of a shared path and tie-ins to local roads.

To minimise impacts of parking disruptions to the community, off-road parking for construction vehicles would be provided within the proposal's ancillary facilities. In addition, a Traffic Management Plan would be developed and implemented during construction. This would include requirements to consult with and inform the community of impacts to the local road network, including disruptions to parking, and implement traffic control measures to manage these impacts.

### 5.1.4 Impacts on public transport

Access for pedestrians and to public transport would be maintained around the construction site during construction. There are seven bus stops within the construction area. These would be temporarily relocated to safe locations to allow for continued access. During the construction of the proposal, the following impacts on buses and passengers would potentially include:

- Longer travel times when travelling through construction areas from speed reduction and additional construction vehicles.
- Temporary relocation of bus stops away from construction zones. Passengers may be required to walk further to relocated bus stops.

Any change to the bus stops in the construction areas would be confirmed by the construction contractor and would be discussed with the bus operator.

### 5.1.5 Impacts on active transport

Detours for pedestrian / cyclist access would be implemented within the proposal area. In particular, the following routes may be affected:

- Existing shared path between the M5 Motorway and Pozieres Avenue
- Existing shared path (running alongside Henry Lawson Drive) between Ruthven Avenue and Keys Parade

The above routes lie within the zone of road widening works and would be temporarily removed as part of construction. Pedestrian and cyclist access would be detoured, and alternative arrangements managed through signage and wayfinding.

### 5.2 Operation impacts

This section provides an assessment of the operational impacts of the proposal on road network performance against the 'without proposal' scenario for the future years 2031 and 2041.

The modelling results have been presented in the form of overall network statistics, corridor travel time and key intersection delays along with the Level of Service (LOS). This section presents the overall results with a detailed discussion and assessment of the 'with proposal' scenario in 2031 and 2041 for the AM, PM and weekend peak periods.

### 5.2.1 Future Traffic Demand

The traffic demands used for the future year models were developed from the 2021, 2031 and 2041 STFM sub-area matrices and link volume plots provided by Transport as part of the proposal. There would be a significant increase in traffic demand in comparison to 2022 existing scenario, which again increases incrementally from year 2031 to 2041. The 'without proposal' scenario modelling suggests an insufficiency in network capacity to cater for the growing traffic demand. The proposal would result in a satisfactory performance in AM, PM and weekend peaks for both 2031 and 2041. Refer to Section 3 in Appendix B.

### 5.2.2 Intersection performance

## AM Peak

Table 5-1 and Table 5-2 present a summary of the performance of the nine key intersections in the study area in 2031 AM peak; while Table 5-3 and Table 5-4 present the intersection performance summary in 2041 AM peak. The six intersections which would be converted to left-in left-out only have been excluded from the following tables.

Table 5-1: 2031 AM Peak Intersection Level of Service Summary 7:45-8:45 AM

| ID | Intersection | Without proposal |  |  | With proposal |  |  |

| ID | Intersection | Without proposal |  | With proposal |  |  |  |
| ---: | :--- | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Volume | Delay | LOS | Volume | Delay | LOS |
| 1 | HLD / Haig Ave | 2,941 | 97 | F | 3,084 | 106 | F |
| 2 | HLD / Rabaul Rd | 2,944 | 12 | A | 3,093 | 26 | B |
| 3 | HLD / Tower Rd | 3,470 | 33 | C | 3,590 | 66 | E |
| 4 | HLD / Milperra Rd | 6,958 | 404 | F | 7,458 | 323 | F |
| 5 | HLD / Keys Pde/Flower power | 2,705 | 44 | D | 2,477 | 41 | C |
| 6 | HLD / Bullecourt Ave | 2,672 | 56 | D | 2,528 | 89 | F |
| 7 | HLD / Pozieres Ave | 2,633 | 53 | D | 2,025 | 111 | F |
| 8 | Milperra Rd / Murray Jones Dr | 3,895 | 172 | F | 4,173 | 8 | A |
| 9 | Milperra Rd / Ashford Ave | 4,349 | 117 | F | 4,648 | 35 | C |

Analysis of 2031 AM modelling results show that for the intersections in the proposal area:

- The Keys Parade intersection would perform at LOS C in both the 'without proposal' scenario and 'with proposal' scenario.
- The Bullecourt Avenue intersection performs at LOS D or better in all scenarios and time periods.
- The Pozieres Avenue intersection performs at LOS C or better in the 'without proposal' scenario and LOS B in the 'with proposal' scenario.

The Stage 1B intersections at Keys Parade and Bullecourt Avenue have similar results for both 'without proposal' and 'with proposal' scenarios in 2031 AM peak period. This is because a good percentage of vehicles who currently use Milperra Road to reach Bullecourt Avenue in the 'without proposal' scenario, would reroute to use Henry Lawson Drive in the 'with proposal' scenario.

This effect is more pronounced in 2041 AM peak period as follows:

- In the 'with proposal' scenario, the Bullecourt Avenue intersection operates at LOS C in the first hour and deteriorates to LOS F in the second hour. This is because the right turn traffic movement from Henry Lawson Drive northbound onto Bullecourt Avenue queues back due to capacity constraints along Bullecourt Avenue between Henry Lawson Drive and Ashford Avenue originating from the Ashford Avenue / Bullecourt Avenue roundabout as illustrated in Figure 5-1. In the 'without proposal' scenario, Bullecourt Avenue is less constrained because a great proportion of vehicles who accessed Henry Lawson Drive to reach Bullecourt Avenue in the 'with proposal' scenario are using Ashford Avenue to reach Bullecourt Avenue. In addition, instead of accessing the local road network via Bullecourt Avenue, northbound vehicles on Henry Lawson Drive would also be able to directly access the local road network via right turn movements that would be removed as part of the proposal. The 'without proposal' scenario performs at LOS D or better.
- The Pozieres Avenue intersection performs at LOS D or better in the 'without proposal' scenario. The performance in the 'with proposal' scenario deteriorates from LOS B in the first hour to LOS F in the second hour. This is due to traffic congestion queuing back from the Bullecourt Avenue intersection to the Pozieres Avenue intersection.

In general, 2041 AM results show that the delays would increase impacting the LOS in comparison to 2031 AM given the increase in traffic volumes between 2031 and 2041.

Figure 5-1: Queuing up at Bullecourt Avenue / Henry Lawson Drive intersection (2041 AM peak Option Scenario)

## PM Peak

Table 5-5 and Table 5-6 present a summary of the performance of the nine key intersections in the study area in 2031 PM peak; while Table 5-7 and Table 5-8 present the intersection performance summary in 2041 PM peak.

Table 5-5: 2031 PM Peak Intersection Level of Service Summary 3:30-4:30 PM

| ID | Intersection | Without proposal |  |  | With proposal |  |  |
| :---: | :--- | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Volume | Delay | LOS | Volume | Delay | LOS |

| ID | Intersection | Without proposal |  |  | With proposal |  |  |
| :---: | :--- | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Volume | Delay | LOS | Volume | Delay | LOS |
| 1 |  | 2,155 | 285 | F | 2,202 | 254 | F |
| 2 | HLD / Rabaul Rd | 2,462 | 95 | F | 2,545 | 77 | F |
| 3 | HLD / Tower Rd | 2,742 | 42 | C | 2,857 | 17 | B |
| 4 | HLD / Milperra Rd | 7,431 | 454 | F | 7,944 | 442 | F |
| 5 | HLD / Keys Pde/Flower power | 2,720 | 43 | D | 2,883 | 96 | F |

| ID | Intersection | Without proposal |  |  | With proposal |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Volume | Delay | LOS | Volume | Delay | LOS |
| 6 | HLD / Bullecourt Ave | 2,436 | 61 | E | 2,794 | 34 | C |
| 7 | HLD / Pozieres Ave | 2,366 | 98 | F | 2,638 | 15 | B |
| 8 | Milperra Rd/ Murray Jones Dr | 4,378 | 40 | C | 4,345 | 51 | D |
| 9 | Milperra Rd/ Ashford Ave | 4,758 | 143 | F | 4,690 | 196 | F |

Analysis of 2031 PM modelling results for intersections in the proposal area indicates:

- The Keys Parade intersection would perform at LOS D or better in both the 'without proposal' scenario and 'with proposal' scenario.
- For the 'without proposal' scenario, the Bullecourt Avenue intersection performs at LOS C during first hour and the performance deteriorates to LOS F in the second hour. The 'with proposal' scenario, would see the Bullecourt Avenue intersection operate at a much improved LOS B. The improvement in performance for 'with proposal' scenario is due to the increased capacity along Henry Lawson Drive as a result of the proposal.
- The Pozieres Avenue intersection performs at a LOS B (in the first hour) and LOS F (in the second hour) in the 'without proposal' Scenario. With the proposal, this would improve to LOS A. The improvement in performance for the 'with proposal' scenario is also due to the increased capacity and dedicated right turn lane southbound along Henry Lawson Drive as a result of the proposal.

In the 2041 PM scenario, with the proposal, the Bullecourt and Pozieres Avenue intersections LOS would improve in both peak hours, and the Keys Parade intersection LOS would improve in the first peak hour, compared to without the proposal. However, the results suggest that increasing delays would impact the LOS at these intersections in comparison to the 2031 PM.

For the intersections outside the proposal area, the 2041 PM scenario performs slightly better than the 2031 PM scenario despite generally higher demand in 2041. This is due to an increase in congestion on the eastbound approach to the Milperra Road / Henry Lawson Drive intersection, which constrains vehicles from accessing Henry Lawson Drive from Milperra Road.

For both 2031 and 2041 scenarios, the results suggest overall better performance for the 'with proposal' scenario in comparison to the 'without proposal' scenario in the PM peak period.

## Weekend Peak

Table 5-9 and Table 5-10 present a summary of the performance of the nine key intersections in the study area in 2031 weekend peak; while Table 5-11 and Table 5-12 present the intersection performance summary in 2041 weekend peak.

Table 5-9: 2031 Weekend Peak Intersection Level of Service Summary 11:30 AM - 12:30 PM

Analysis of 2031 weekend peak modelling results for intersections in the proposal area:

- The Keys Parade intersection would perform at LOS B in the 'without proposal' scenario and LOS C in the 'with proposal' scenario due to an increase in delay.
- The Bullecourt Avenue intersection would perform at LOS B in all scenarios and time periods.
- The Pozieres Avenue intersection is expected to operate at LOS A in all scenarios and time periods.

In 2041 weekend for the 'without proposal' and 'with proposal' scenario, the overall LOS would not differ much from the 2031 modelled values.

For both 2031 and 2041 scenarios, the results suggest that the weekend modelling produces similar performance for the 'without proposal' scenario and 'with proposal' scenario.

### 5.2.3 Travel time

Future travel times along Henry Lawson Drive for the proposal scenario has been assessed against the 'without proposal' for the future years 2031 and 2041 for the AM, PM and weekend peaks.

The travel time statistics have been analysed for the following two sections along Henry Lawson Drive illustrated in Figure 5-2.

1. Henry Lawson Drive between the M5 Motorway and Bullecourt Avenue
2. Henry Lawson Drive between Bullecourt Avenue and Milperra Road

Figure 5-2: Travel Time Route and Sub-sections

## AM Peak

For the weekday AM peak period, the travel times in northbound and southbound direction along Henry Lawson Drive for all the modelled scenarios in 2031 and 2041 are presented in Table 5-13.

Table 5-13: AM peak 'with proposal' modelling travel time results comparison

| Direction | 2031 |  |  | 2041 |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | Existing | 'Without proposal' | 'With proposal' | 'Without proposal' | 'With proposal' |
| 7:45 AM-8:45 AM |  |  |  |  |  |
| Northbound | 04:03 | 05:54 | 04:23 | 06:29 | 08:10 |
| Southbound | 04:26 | 04:35 | 04:33 | 04:37 | 04:32 |
| 8:45 AM-9:45 AM |  |  |  |  |  |
| Northbound | 05:38 | 07:08 | 06:50 | 09:45 | 08:35 |
| Southbound | 04:22 | 04:48 | 04:37 | 05:20 | 04:35 |
| Average |  |  |  |  |  |
| Northbound | 04:51 | 06:31 | 05:37 | 08:07 | 08:23 |
| Southbound | 04:24 | 04:42 | 04:35 | 04:59 | 04:33 |

During the AM peak in 2031, the average northbound travel time along Henry Lawson Drive is likely to decrease by about one minute for the 'with proposal' scenario compared to the 'without proposal' scenario. The difference in average southbound travel time along Henry Lawson Drive for both scenarios are likely to be negligible (seven seconds difference).

In the 2041 AM peak, the average northbound travel time is expected to increase by 16 seconds with the proposal compared to without the proposal. The average southbound travel time along Henry Lawson Drive is expected to decrease by about 25 seconds in the 'with proposal' scenario compared to the 'without proposal' scenario.

The reason for higher travel times in the 'with proposal' scenario during 2041 AM peak period is due to queue spill back at the Bullecourt Avenue intersection as detailed in Section 5.2.2.

## PM Peak

For PM peak, the northbound and southbound travel times along the Henry Lawson Drive for all the modelled scenarios in 2031 and 2041 are presented in Table 5-14.

Table 5-14: PM peak 'with proposal' modelling travel time results comparison

| Direction | 2031 |  |  | 2041 |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | Existing | 'Without proposal' | 'With proposal' | 'Without proposal' | 'With proposal' |
| 3:30 PM-4:30 PM |  |  |  |  |  |
| Northbound | 03:55 | 06:02 | 04:46 | 09:02 | 06:04 |
| Southbound | 04:26 | 04:10 | 03:43 | 04:18 | 03:44 |
| 4:30 PM-5:30 PM |  |  |  |  |  |
| Northbound | 03:54 | 14:22 | 08:47 | 16:30 | 13:29 |
| Southbound | 04:23 | 04:07 | 03:41 | 03:58 | 03:42 |
| Average |  |  |  |  |  |
| Northbound | 03:54 | 10:12 | 06:47 | 12:46 | 09:47 |
| Southbound | 04:24 | 04:09 | 03:42 | 04:08 | 03:43 |

During the PM peak in 2031, the average northbound travel time along Henry Lawson Drive is expected to decrease by about three minutes during the 'with proposal' scenario compared to the 'without proposal' scenario. The average southbound travel time along Henry Lawson Drive is expected to decrease by 27 seconds in the 'with proposal' scenario compared to the 'without proposal' scenario. In both directions, the proposal is able to accommodate demand during the PM peak.

In 2041, the average northbound travel time is also expected to decrease by about three minutes in the 'with proposal' scenario compared to the 'without proposal' scenario. The southbound travel time comparison is likely to be similar to 2031 PM (i.e., a 25 second reduction with the proposal compared to without the proposal).

## Weekend Peak

For the weekend peak period, the travel times in northbound and southbound direction along the Henry Lawson Drive for all the modelled scenarios in 2031 and 2041 are presented in Table 5-15.

In the absence of available weekend travel time data and for the purpose of comparison, AM travel time data was used for the existing scenario. This adopts the worst-case existing travel time, which is expected to be a conservative estimate of existing travel time for the weekend peak hours.

Table 5-15: Weekend peak with proposal modelling travel time results comparison

| Direction | 2031 |  |  | 2041 |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | Existing | 'Without proposal' | 'With proposal' | 'Without proposal' | 'With proposal' |
| 11:30 AM-12:30 PM |  |  |  |  |  |
| Northbound | 04:03 | 03:57 | 03:41 | 03:59 | 03:49 |
| Southbound | 04:26 | 04:27 | 04:23 | 04:30 | 04:22 |
| 12:30 PM-1:30 PM |  |  |  |  |  |
| Northbound | 05:38 | 04:06 | 04:07 | 04:01 | 04:03 |
| Southbound | 04:22 | 04:41 | 04:19 | 04:53 | 04:20 |
| Average |  |  |  |  |  |
| Northbound | 04:51 | 04:02 | 03:54 | 04:00 | 03:56 |
| Southbound | 04:24 | 04:34 | 04:21 | 04:42 | 04:21 |

During the weekend peak in 2031, the average northbound and southbound travel times along Henry Lawson Drive are likely to be similar in both the 'without proposal' and 'with proposal' scenarios ('with proposal showing an improvement of roughly 10 seconds in either direction).

In 2041, the average northbound travel time is also expected to be about the same in both the 'with proposal' and the 'without proposal' scenarios. The average southbound travel times improve by 21 seconds in the 'with proposal' scenario on average compared to the 'without proposal' scenario in 2041.

This is due to the proposed network being able to accommodate weekend demand in 2041.

### 5.2.4 Overall network performance

Overall network performance can be quantified based on a number of statistical outputs, which provide a level of understanding and comparison between different modelled scenarios. Some of these performance statistics include:

- VKT (Vehicle Kilometres Travelled) - Total kilometres travelled by all vehicles in the model. Complete VKT are trips completing a trip from origin to destination. Incomplete VKT are trips that have started but remain in the network after the simulation period has ended.
- VHT (Vehicle Hours Travelled) - Total travel hours by all vehicles in the model. Complete VHT include vehicles complete a trip from origin to destination. Incomplete VHT includes vehicles that have started but remain in the network after the simulation period has ended.
- Total Number of Stops - Total number of stops for all vehicles determined from the model.
- Average Speed - Measures the average traffic speed during the simulation for all vehicles.
- Latent Demand - Number of vehicles that were unable to enter the network due to queues extending beyond the model study area.

The network-wide model statistics were extracted from the weekday AM, PM and the weekend scenario models to establish an overall network performance.

Table 5-16, Table 5-17 and Table 5-18 show overall network performance during the AM peak, PM peak and weekend peak in 2031 and 2041. The 'with proposal' scenario is expected to operate with a slightly better performance in comparison to the 'without proposal' in both 2031 and 2041 peak periods.

For the AM network performance outlined in Table 5-16, there is a greater difference in latent demand between the 'without proposal' and the 'with proposal' scenarios in 2031 than in 2041. This is due to the northbound queuing at the Bullecourt Avenue / Henry Lawson Drive intersection (refer to Figure 5-1).

In the 2041 'with proposal' scenario, the right turn traffic movement from Henry Lawson Drive northbound onto Bullecourt Avenue queues back due to capacity constraints along Bullecourt Avenue between Henry Lawson Drive and Ashford Avenue originating from the Ashford Avenue / Bullecourt Avenue roundabout.

In the 2041 'without proposal' scenario, a great proportion of vehicles travelling north-to-south on the corridor are using Ashford Avenue instead of the congested Henry Lawson Drive. In the 'with proposal' scenario, with the increased capacity on Henry Lawson Drive, some of the north-to-south demand transfers to Henry Lawson Drive and Bullecourt Avenue to travel south, resulting in a constrained Bullecourt Avenue. In addition, in the 2041 'without proposal' scenario, northbound vehicles on Henry Lawson Drive access the local road network via right turn movements that would be removed as part of the proposal. In the 2041 'with proposal' scenario, these vehicles would access the local road network via Bullecourt Avenue, adding to the constrained Bullecourt Avenue.

The combination of these impacts result in a greater difference in latent demand between the 'without proposal' and the 'with proposal' scenarios in 2031 AM peak than in 2041 AM peak.

Table 5-16: Overall Network Performance during AM Peak

### 5.2.5 Impacts on property access

During operation, the proposal would maintain access to all properties within the proposal area.
There are five residential properties within the proposal area with direct access to Henry Lawson Drive (497, 499, 503, 553, 553A Henry Lawson Drive, Milperra). 497, 499 and 503 Henry Lawson Drive are located south of the Flower Power Garden Centre and 553 and 553A Henry Lawson Drive are located south of the Hermies Avenue intersection.

For 497, 499 and 503 Henry Lawson Drive, due to the installation of a raised concrete median along Henry Lawson Drive, driveway access would be converted to left-in left-out only. Residents wishing to turn right into their properties would need to use local road detours to access their properties. There would also be adjustments to driveway connections for these properties within the existing road reserve owned by Transport.

For 553 and 553A Henry Lawson Drive, driveway access would also be converted to left-in left-out only. This would be due to the Henry Lawson Drive / Hermies Avenue intersection only permitting left turning vehicles into the kerbside lane to travel south through the Pozieres Avenue intersection. To access the northbound carriageway of Henry Lawson Drive, residents would need to turn around at either Bransgrove Road or Maxwell Avenue, Panania (about 750 metres south of their properties).
The proposal would require adjustments to driveway connections to local roads to the Milperra Sports Centre, at the BP Service Station (5 Bullecourt Avenue, Milperra) and at some residential properties adjacent to road or footpath work on Ingram Avenue and Fromelles Avenue. These driveway connections would be within the existing road reserve owned by Canterbury Bankstown Council.

Landowners and occupiers would be consulted about any potential access impacts prior to and during construction.

### 5.2.6 Impacts on local road access

The proposal would involve installation of a raised concrete median along Henry Lawson Drive within the proposal area, which would convert a number of local road intersections to be left-in left-out only. The concept design proposes left-in left-out only access at the Henry Lawson Drive intersections of Ruthven Avenue, Whittle Avenue, Amiens Avenue, Ganmain Crescent, Fromelles Avenue and Hermies Avenue. Local residents wishing to turn right from Henry Lawson Drive into these local roads would need to turn right at signalised intersections of Keys Parade, Bullecourt Avenue or Pozieres Avenue to access the local road network to access these local roads

At Hermies Avenue, a raised lane barrier would be installed so that vehicles from Hermies Avenue cannot switch lanes to turn into Pozieres Avenue and must continue to the south.

The proposal would also provide a local link road between Auld Avenue and Keys Parade, extension of Raleigh Road to Keys Parade and roundabout at the Raleigh Road / Keys Parade intersection. These features would provide new local road access routes to the south-west of Henry Lawson Drive to minimise disruption to motorists of the local road access changes.

While there are a number of local road access routes that motorists could take due to left in and left out arrangements, the shortest new local access routes are presented in Table 5-19 and are shown in Figure 5-3 and Figure 5-4.

Table 5-19: Local road access changes for proposed left-in left-out intersections

| Left-in Left-out Intersection | Impacted right turn direction | Number of vehicles impacted in peak period |  |  | Shortest local road access route | Approximate detour distance (m) | Reference Figure |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | 2031 AM | 2031 PM | 2031 WK |  |  |  |

### 5.2.7 Impacts on parking

To safely connect the Auld Avenue link road with Auld Avenue, up to eight parking spaces on Auld Avenue adjacent to the Gordon Parker Reserve would be removed. This would impact community members using the reserve during sport events and other busy periods. During detailed design, Transport would consider opportunities to minimise the number of parking spaces that need to be removed.
There would be no other changes to parking due to the proposal.

### 5.2.8 Impacts on public transport

The operation of the proposal would not result in any changes to existing public or school bus services. Most bus stops within the proposal area would be retained with like-for-like replacement of the existing bus stop (where relevant).

However, the bus stop located on the Henry Lawson Drive northbound carriageway, south of Pozieres Avenue intersection would be relocated about 25 metres north of Pozieres Avenue.

### 5.2.9 Impacts on active transport

There is a proposed three metres wide concrete shared path along the western side of Henry Lawson Drive Stage 1B upgrade between the M5 Motorway and Keys Parade. This shared path would connect into shared path across the new Milperra Drain bridge and along Henry Lawson Drive to connect into existing Council paths.

In addition, new footpaths would be constructed along Ingram Avenue and Fromelles Avenue to provide additional access for pedestrians along the corridor. This would tie into existing lengths of footpaths to the north and south along Henry Lawson Drive.

### 5.2.10 Operational road safety

Whilst no dedicated road safety upgrades have been undertaken in the preferred 'with proposal', the increased intersection capacity and smoother operation of the network in general is expected to significantly improve road safety. Dual carriageway roads generally reduce crashes in relation to single carriageway roads, mainly due to the separation between opposing traffic flows. Head-on collisions are expected to reduce due to the physical separation of the opposing carriageways. Rear end collisions are also expected to reduce due to limiting right turn movements to dedicated right turn lanes at intersections only.

In addition, the following intersection upgrades are expected to improve road safety:

- Lawson Drive intersections of Auld Avenue, Ruthven Avenue, Whittle Avenue, Amiens Avenue, Ganmain Crescent, Fromelles Avenue and Hermies Avenue. Henry Lawson Drive / Auld Avenue
- Conversion of the intersection into a left-in left-out reduces risk of vehicles turning into incoming traffic.
- Henry Lawson Drive / Bullecourt Avenue intersection
- Provision of additional right turn bays would increase turn storage capacity and reduce risk of road blockage and rear end collisions.
- Conversion of left turn exit lane from Bullecourt Avenue into slip lane would improve safety of that turn.
- Henry Lawson Drive / Pozieres Avenue intersection
- Provision of right and left turn bays would increase turn storage capacity and reduce risk of road blockage and rear end collisions
- Relocation of the Pozieres Avenue bus stop about 25 metres north from its current location would improve passenger embarking and disembarking as well as traffic and pedestrian movements at the intersection.

## 6 Management measures

Table 6-1 provides a summary of the mitigation measures and environmental safeguards that are recommended for the proposal based on the assessment of potential traffic and transport impacts.

Table 6-1: Traffic impact mitigation measures

| Impact | Environmental safeguard | Responsibility | Timing |
| :---: | :---: | :---: | :---: |
| Traffic and transport | A Traffic Management Plan (TMP) would be prepared and implemented as part of the CEMP. The TMP would be prepared in accordance with the Transport for NSW Traffic Control at Work Sites Manual (RMS, 2020) and QA Specification G10 Control of Traffic (Transport, 2020). The TMP would include: <br> - confirmation of haulage routes <br> - swept path analysis of haulage vehicles using the Ashford Avenue roundabout <br> - measures to maintain access to local roads and properties <br> - construction traffic control plans outlining site-specific traffic control measures (including signage) to manage and regulate traffic movement <br> - measures to maintain pedestrian and cyclist access <br> - requirements and methods to consult and inform the local community of impacts on the local road network, including disruptions to parking <br> - access to construction sites including entry and exit locations and measures to prevent construction vehicles queuing on public roads <br> - a response plan for any construction traffic incident <br> - consideration of other developments that may be under construction to minimise traffic conflict and congestion that may occur due to the cumulative increase in construction vehicle traffic <br> - monitoring, review and amendment mechanisms. | Contractor | Preconstruction/ construction |
| Construction site access | Construction site access would be designed and implemented in consideration of: <br> - road design guidelines and turning paths for heavy vehicles <br> - appropriate sight distances to allow traffic to safely enter and exit <br> - visibility of compliant warning and way finding signs <br> - use of accredited traffic controllers, where appropriate and/or other controls to separate, slow down or temporarily stop traffic for safe entry/exit <br> - minimising use of local roads, where practical <br> - provision of deceleration lanes at accesses next to highly trafficked roads | Contractor | Preconstruction/ construction |

| Impact | Environmental safeguard | Responsibility | Timing |
| :---: | :---: | :---: | :---: |
| Traffic impacts | Further traffic modelling would be carried out during detailed design following confirmation of the construction methodology and traffic staging to confirm the potential for traffic impacts and identify whether any additional mitigation measures or traffic control measures would be required. | Contractor | Detailed design |
| Impact on bus stops or routes | Temporary and permanent bus stop relocation would be discussed with the relevant bus operator and community notified. | Transport / Contractor | Detailed design/ Preconstruction |
| Temporary access changes | Detours during temporary access changes would be implemented with directional signage along alternate routes. | Contractor | Construction |
| Heavy Vehicle Movements | Heavy vehicle movements to be limited during peak traffic periods (i.e., between 7:45 AM to 08:45 AM, 3:30 PM to 4:30 PM, 11:30 AM to 12:30 PM), where practical. | Contractor | Construction |
| Traffic management measures | Any temporary traffic diversions, clearways and road closures would be implemented in accordance with Transport Management Centre (TMC) and Canterbury Bankstown City Council requirements. | Contractor | Construction |
| Property access | Property access would be maintained where feasible and reasonable and property owners would be consulted well in advance of work starting that may temporarily restrict or control access. <br> - Consultation will be carried out with the community regarding alternate access arrangements during operation associated with the provision of left-in leftout intersections. <br> - Notification will be issued to emergency services about changes in traffic conditions. | Transport / Contractor | Construction |
| Local road or shared path closures | Relevant councils would be consulted with prior to any local road or shared path closures to identify suitable mitigation measures such as detour routes. | Contractor | Construction |
| Parking | Off-road parking for construction vehicles would be provided within the ancillary facility and construction areas. | Contractor | Construction |
| Damage to local roads | Any damage to the local road network identified to be caused by construction vehicles for the proposal would be remediated by the contractor to be similar to the existing road condition. | Contractor | Construction |
| Bus stops | Any changes to bus stops would be discussed with bus operators and the community notified prior to the changes. | Contractor | Construction |
| Auld Avenue parking | During detailed design, Transport will consider opportunities to minimise the number of parking spaces that need to be removed. | Transport | Detailed design |

## 7 Conclusion and justification

Transport proposes to upgrade Henry Lawson Drive along a 1.8-kilometre section between Auld Avenue, Milperra and the M5 Motorway, Milperra (the proposal). The proposal would include widening Henry Lawson Drive from two to four lanes, constructing a new local link road between Auld Avenue and Keys Parade, extending Raleigh Road and modifying the Bullecourt Avenue / Ashford Avenue intersection. The operational traffic performance of the proposal has been assessed using AIMSUN traffic modelling for the preferred scenario against the 'without proposal' scenario in 2031 and 2041. The modelling results show the following:

- Across the future year scenarios, the results suggest a slightly better performance for the 'with proposal' scenario compared to the 'without proposal' scenario in AM, PM and weekend peaks for both 2031 and 2041 due to improved network average speed with the proposal.
- Henry Lawson Drive Travel Time
- The 2031 AM peak period shows an average reduction in travel time in the northbound and southbound directions compared to the 'without proposal' scenario. In 2041, there would be an increase in travel times in the northbound direction in the 'with proposal' scenario compared to the 'without proposal' scenario, with the opposite result in the southbound direction. This would be due to queue spill back at the Bullecourt Avenue / Henry Lawson Drive intersection.
- During PM peak periods, Henry Lawson Drive northbound travel time is expected to decrease by more than three minutes in 2031 and by three minutes in 2041 in the 'with proposal' scenario compared to the 'without proposal' scenario. This is due to there being higher demand for northbound traffic in 2041. The average southbound travel time along Henry Lawson Drive is expected to decrease by about 30 seconds in the 'with proposal' scenario compared to the 'without proposal' scenario in both 2031 and 2041. The network would be able to accommodate southbound demand in both 2031 and 2041.
- During the weekend peak in 2031, the average northbound and southbound travel times along Henry Lawson Drive are likely to be similar in both the 'without proposal' and 'with proposal' scenarios. The average southbound travel time along Henry Lawson Drive is expected to reduce by about 20 seconds in the 'with proposal' scenario compared to the 'without proposal' scenario in 2041, with northbound travel times improving by about four seconds on average. This is due to the network being better able to accommodate weekend demand in both 2031 and 2041.
- The travel time results suggest a better performance for the 'with proposal' scenario compared to the 'without proposal' scenario in all time periods modelled, 2041 AM peak period being an exception.
- Level of Service (LOS)
- Intersection LOS at Keys Parade and Bullecourt Avenue have similar results for the 'without proposal' and 'with proposal' scenarios in 2031 AM peak period. This is because a good percentage of vehicles who currently use Milperra Road to reach Bullecourt Avenue in the 'without proposal' scenario, would reroute to use Henry Lawson Drive in the 'with proposal' scenario.
- For 2041 AM peak period, in the 'with proposal' scenario, the Bullecourt Avenue intersection operates at LOS C in the first hour and deteriorates to LOS F in the second hour. This is because the right turn traffic movement from Henry Lawson Drive northbound onto Bullecourt Avenue queues back due to capacity constraint along Bullecourt Avenue between Henry Lawson Drive and Ashford Avenue, originating at the Ashford Avenue roundabout This traffic congestion propagates further downstream impacting the performance of Pozieres Avenue intersection. This increase in delay at the intersection is due to an increasing number of vehicles turning at the intersection, whereas in the 'without proposal' scenario, they would use Milperra Road and Ashford Avenue (if travelling from north of the proposal area) or turn directly into the local road network (if travelling northbound on Henry Lawson Drive).
- For both 2031 and 2041 scenarios, the results suggest a better performance for the 'with proposal' scenario in comparison to the 'without proposal' scenario in the weekday PM peak period. The weekend modelling produces similar results for the 'without proposal' scenario and the 'with proposal' scenario.
- In general, 2041 AM and PM peak periods show that the delays would increase impacting the LOS at signalised intersections within the proposal area in comparison to the 2031 AM and PM due to increased demand in 2041. However, in the 2041 weekend peak for the 'without proposal' and 'with proposal' scenarios, the overall LOS would not differ much from the 2031 modelled values.
- It should be noted that the Henry Lawson Drive traffic performance would likely see its best benefits once the entire Henry Lawson Drive upgrade program is completed. With only the Stage 1A and Stage 1B upgrades, the merging from two to one lane located north of the Tower Road intersection acts as a bottleneck, impacting the performance of vehicles travelling along the corridor.

The proposal providing the traffic intersection benefits, in conjunction with other stages of the Henry Lawson Drive upgrade program, would ease traffic congestion issues and improve freight access between the M5 Motorway and Hume Highway.

The concept design proposes a left-in left-out for the Henry Lawson Drive intersections of Ruthven Avenue, Whittle Avenue, Amiens Avenue, Ganmain Crescent, Fromelles Avenue and Hermies Avenue. The local residents wishing to turn right from Henry Lawson Drive into these local roads would need to use signalised intersections at Keys Parade, Bullecourt Avenue and Pozieres Avenue to access the local road network.

There is potential for temporary traffic impacts during construction associated with construction traffic generated by the proposal, construction vehicles accessing the construction zones and temporary access restrictions. Several mitigation measures and safeguards would be implemented to reduce the potential traffic and transport impacts, where possible, which would be outlined in a Construction Traffic Management Plan that would be prepared and approved prior to construction of the proposal. The CTMP would be implemented during construction and would detail the final traffic arrangements, construction boundaries, access points, heavy vehicle haulage routes and strategies to minimise any potential adverse traffic and transport impacts from construction of the proposal.

## 1 Introduction

### 1.1 Background

Aurecon was commissioned by Transport for NSW (TfNSW) to deliver the Concept Design Services for Henry Lawson Drive (HLD) upgrade Stage 1B. For traffic and transportation study, a microsimulation corridor model of Henry Lawson Drive in the study area is required. This model is intended to be used for testing few potential upgrade options. The options modelling will enable TfNSW to test different combinations of upgrades to determine the best possible option to implement on the network to improve network performance.

As part of the model development process, Aurecon undertook a model calibration and validation exercise to ensure that the model developed is fit-for-purpose and can be used for option evaluation. The methodology and parameters adopted for the base model are aligned to the TfNSW Traffic Modelling Guidelines (Modelling Guidelines).

This report outlines the steps undertaken in the development of the Base model, data analysis, network coding and results of model calibration and validation. This document does not include discussion of the various option packages that will be tested from the base model. A separate option modelling report will subsequently be provided to outline the various options, corresponding results, and analysis.

### 1.2 Project Background

Transport for NSW is investigating the upgrade of 7.5-kilometre stretch of Henry Lawson Drive between M5 Motorway, Milperra, Lansdowne and Hume Highway. The route corridor of Henry Lawson Drive serves as a major north-south link for movement of freight and general traffic. The land use in the vicinity of the corridor includes a mix of residential, industrial and retail land use as well as airport facilities. The upgrade would help in ensuring that the road corridor can meet growing traffic demand, with residential, commercial, and industrial development expected to increase in the coming years.

The upgrade would be carried out in four stages (Stages 1A, 1B, 2 and 3).
The Stage 1A upgrade of Henry Lawson Drive would provide more capacity for vehicles travelling through the intersection of Henry Lawson Drive, Milperra Road and Newbridge Road. It would improve efficiency along the corridor and safety for motorists and pedestrians.

This project, Stage 1B involves upgrade of Henry Lawson Drive along a 1.8-kilometre section between Keys Parade and the approach to the M5 Motorway. The upgrade of key intersections and widening of Henry Lawson Drive would improve traffic capacity, decrease travel time, and enhance and driver safety.

### 1.2.1 Objectives

The main objectives in developing the microsimulation model are as follows:

- Develop a base case microsimulation model in accordance with the TfNSW Traffic Modelling Guidelines Version $1.0^{1}$ to ensure that it is fit-for-purpose to test future year option scenarios.
- Develop future year flows based on STFM outputs.
- Assess the proposed options along Henry Lawson Drive
- Identify short comings of each option and provide potential remediations to minimise congestion in the study area.
The project study area covers Henry Lawson Drive between Hume Highway and M5 Motorway as shown in Figure 1-1 below.

[^0]

Figure 1-1: Henry Lawson Drive Stage 1B model study area

## 2 Model Form

The development of the model has been undertaken using the Aimsun software suite. Aimsun is an integrated modelling tool which is often used for large scale and complex networks. Aimsun allows different model tiers to be developed in a single model file, resulting in improved route choice network assignment. The geometry configuration function in Aimsun also allows users to code and manage different model options in a single model file.

As part of concept design for Henry Lawson Drive Stage 1A, a microsimulation traffic model was developed using Aimsun Next Version 20.0.3. For Stage 1B, the existing Aimsun model was extended to include the section of Henry Lawson Drive between Keys Parade and South-Western Motorway (M-5). Further, it is suggested that the same version be used for future option testing.

### 2.1 Methodology

The key steps in the modelling process include the following:

- Network development and refinement that involved extension of existing model for Henry Lawson Drive Stage 1A to include Stage 1B study area network.
- Traffic demand estimation
- Model calibration and validation.

Data inputs used for the base model and their sources are discussed at length in Chapter 3. Figure 2-1 illustrates the general modelling methodology adopted in building the base model.

Calibrated Micro Model

Figure 2-1: Methodology Overview

### 2.2 Model Network

The modelled base network includes the following mainline extents:

- Henry Lawson Drive southbound between south of Hume Highway and south of M5 motorway off-ramp.
- Henry Lawson Drive northbound between south of M5 Motorway on-ramp and south of Hume Highway.

Figure 2-2 shows the Aimsun base model network, which aligns with the study area in Figure 1-1.

Figure 2-2: Modelled network HLD1B (Aimsun network snapshot with Zone centroid ID's)

### 2.2.1 Extension of HLD-1A model to include HLD-1B

The key steps in the extension of HLD-1A model (initial model) to include HLD-1B project area are the following:

- Import Open Street Map background to initial model.
- Extend the model to include HLD-1B project area network as shown in Figure 2-3.
- All intersections were coded as per the existing type of intersection control such as priority or signalised. The type of intersection control at each intersection in the project area is shown in Table 2-1.
- Public transport and school bus services were also observed in the study area. The road network infrastructure for bus services beyond Henry Lawson Drive corridor is included in the model and is reserved for use by public transport only. This is to account for the impact of bus services within the study area.

Figure 2-3: Overview of model with open street map background.

Table 2-1: Intersections included in the Base model.

| \# | Location | Type |
| :---: | :---: | :---: |

| 26 | Henry Lawson Drive \& Hazel Street | Priority |
| 27 | Henry Lawson Drive \& Hynes Street | Priority |

### 2.3 Model Date and Time Periods

For AM and PM modelling, the traffic surveys were undertaken at various locations in the study area on $23^{\text {rd }}$ March 2022 (Wednesday) and from $28^{\text {th }}$ February 2018 to $5^{\text {th }}$ March 2018. The traffic survey data is collected with a 15-minute interval and their collection locations are presented in Table 3-2.
In the case weekend model, TfNSW provided SCATS detector count data for $26^{\text {th }}$ March 2022 (Saturday), $27^{\text {th }}$ March 2022 (Sunday), $02^{\text {nd }}$ April 2022 (Saturday) and $03^{\text {rd }}$ April 2022 (Sunday), and also traffic survey data for 20 ${ }^{\text {th }}$ February 2021 (Saturday).

### 2.3.1 Weekday Peak

An analysis was undertaken to identify the most suitable Weekday AM and PM peak period. The key steps in identifying the peak hour include following:

- Total hourly traffic counts for all surveyed intersections based on 2022 and 2018 traffic survey data was calculated with hours staggered at 15 minutes for AM period (06:00 AM to 10:00 AM) and PM period (03:00 PM to 07:00PM). The staggered hour in both AM and PM period with maximum traffic was identified as peak hour as presented in Figure 2-4.

Figure 2-4: Total hourly traffic count during AM and PM peak period staggered at 15-minute interval

- AM peak hour was clearly identified as 07:45 AM to 08:45 AM.
- For PM period, peak traffic was observed for 03:15 PM to 05:45 PM, requiring further analysis to identify clear peak PM period.
- Google's typical traffic volume viewer was used to study typical traffic condition prevailing on Henry Lawson Drive from 02:45 PM to 06:15 PM at 15-minute interval on a representative weekday (Wednesday). The google images for typical traffic on Henry Lawson Drive corridor were collated and compared. This is presented in Appendix A. The study of typical traffic suggests that congestion on Henry Lawson Drive peaks between 03:30 PM to 04:30 PM. Considering the peak traffic volume and typical Google traffic, peak hour during PM is identified as 03:30 PM to 04:30 PM.

Based on analysis, the peak traffic time periods were determined as follows:

- Weekday Morning (AM) period: 06:45-09:45 AM
- Warm up: 06:45-07:45 AM
- Peak Hour 1: 07:45-08:45 AM
- Peak Hour 2: 08:45-09:45 AM
- Weekday Afternoon (PM) period: 02:30-05:30 PM
- Warm up: 02:30-03:30 PM
- Peak Hour 1: 03:30-04:30 PM
- Peak Hour 2: 04:30-05:30 PM

### 2.3.2 Weekend Peak

An analysis was undertaken to identify the most suitable Weekend peak period. The key steps in identifying the peak hour include following:

- The average of hourly traffic counts of five surveyed midblock counts in 2022 for two weekends was calculated. The staggered hour with maximum traffic was identified as peak hour as presented in Figure 2-5.

Figure 2-5: Average hourly traffic count during weekend period

- Weekend peak hour was identified as 11:30 AM to 12:30 PM on Saturdays.

Based on analysis, the peak traffic time periods were determined as follows:

- Weekend peak period: 10:30 AM - 01:30 PM
- Warm up: 010:30 AM - 11:30 AM
- Peak Hour 1: 11:30 AM - 12:30 PM
- Peak Hour 2: 12:30-01:30 PM

### 2.4 Assumptions and Limitations

The model has been specifically developed to achieve the objectives of this project. Following enlists some of the modelling assumptions and limitations:

- Calibration has been undertaken for 2022 traffic conditions.
- For AM and PM model, the traffic count data has been sourced from Matrix surveys undertaken during 2022 for Stage 1B and 2018 for Stage 1A portion. The traffic counts used for model calibration are therefore a mix of both 2022 and 2018 traffic data. It has however been verified that the collected dates are representative of typical day traffic conditions. The flow differences have also been checked and balanced through the network.
- For weekend model, the traffic count data has been sourced from TfNSW's SCATS detector data collected in 2022 and traffic survey data collected by Matrix in 2021. The heavy vehicle percentages (HV\%) for weekend peak period calculated from 2022 midblock count survey was comparable to the AM peak period. Therefore, HV\% from AM peak period was assumed in this model.
- The Travel Time data has been sourced from HERE data and was collected in 2018 with 15-minute intervals.
- It has been assumed that the available traffic data are true representation of existing conditions.
- Any upstream or downstream congestion outside the model study area has not been considered.

Table 3-1 presents a summary of various data types used for the study, their sources, and application in the model.

Table 3-1: Road Network Datasets

| Data type | Source | Application |
| :--- | :--- | :--- |
| Base model | TfNSW/ Aurecon - Base model for HLD <br> Stage 1A | Base model from Stage 1A extended to <br> include Stage 1B study area. |
| Aerial imagery | Open Street Maps, 2019 Nearmap Imagery | Model network coding, geometry verification |
| Road Classification, <br> Speed Limit Data | Desktop review | Model network coding |
| Traffic Survey Counts | TfNSW provided survey data (Matrix) for 19 <br> intersections and five midblock locations | Traffic survey counts is used for the purpose <br> of model calibration. |
| SCATS traffic count <br> and Signal Data | TfNSW - Count data for eight intersections <br> and signal data (phase splits / times and <br> cycle times (IDM)) | Signal coding and model development |
| Travel Time Survey <br> Data | HERE data provided by TfNSW. | Used for the purpose of model validation |
| Public transport <br> operations | Bus stops, route information data and <br> timetable data were obtained from TfNSW | Coding of bus routes in the base model |
| Zoning and Traffic <br> demands | TfNSW Model | Zoning and prior traffic demands from <br> provided model have been retained. |
| Strategic Travel Model | TfNSW Model | Future demand projection |

### 3.1 Traffic Count Data

Intersection survey counts along with midblock counts and SCATS data formed the inputs to model calibration.

A summary of the traffic survey data available for weekdays along with the collection date is presented in Table 3-2.

Table 3-2: Traffic survey count data summary for weekday

| $\#$ | Intersection | Type | Collection Date | Vehicle Types |
| :--- | :--- | :--- | :--- | :--- |
| 1 | Henry Lawson Drive/ Flinders Road | Priority | $28-02-2018$ | Light and Heavy Vehicles |
| 2 | Henry Lawson Drive/ Keys Parade | Signalised | $23-03-2022$ | Light and Heavy Vehicles |
| 3 | Henry Lawson Drive/ Newbridge Road/ <br> Milperra Road | Signalised | $10-04-2018$ | Light and Heavy Vehicles |
| 4 | Henry Lawson Drive/ Tower Road | Signalised | $23-02-2021$ | Light and Heavy Vehicles |
| 5 | Henry Lawson Drive/ Haig Avenue | Signalised | $28-02-2018$ | Light and Heavy Vehicles |
| 6 | Henry Lawson Drive/ Rabaul Road | Priority | $19-11-2019$ | Light and Heavy Vehicles |
| 7 | Henry Lawson Drive/ Auld Avenue | Priority | $23-02-2021$ | Light and Heavy Vehicles |

| $\#$ | Intersection | Type | Collection Date | Vehicle Types |
| :--- | :--- | :--- | :--- | :--- |
| 8 | Milperra Road/ Murray Jones Drive | Signalised | $10-04-2018$ | Light and Heavy Vehicles |
| 9 | Milperra Road/ Ashford Avenue | Signalised | $23-03-2022$ | Light and Heavy Vehicles |
| 10 | Henry Lawson Drive/ Raleigh Road | Priority | $23-03-2022$ | Light and Heavy Vehicles |
| 11 | Henry Lawson Drive/ Ruthven Avenue | Priority | $23-03-2022$ | Light and Heavy Vehicles |
| 12 | Henry Lawson Drive/ Whittle Avenue | Priority | $23-03-2022$ | Light and Heavy Vehicles |
| 13 | Henry Lawson Drive/ Amiens Avenue | Priority | $23-03-2022$ | Light and Heavy Vehicles |
| 14 | Henry Lawson Drive/ Bullecourt <br> Avenue | Signalised | $23-03-2022$ | Light and Heavy Vehicles |
| 15 | Henry Lawson Drive/ Ganmain <br> Crescent/ Fromelles Avenue | Priority | $23-03-2022$ | Light and Heavy Vehicles |
| 16 | Henry Lawson Drive/ Hermies Avenue | Priority | $23-03-2022$ | Light and Heavy Vehicles |
| 17 | Henry Lawson Drive/ Pozieres Avenue | Signalised | $23-03-2022$ | Light and Heavy Vehicles |
| 18 | Henry Lawson Drive/ South Western <br> Motorway - M5 | Signalised | $28-02-2018$ | Light and Heavy Vehicles |
|  |  |  |  |  |

The traffic count data for light and heavy vehicles in AM peak period (7:45 AM to 9:45 AM) and PM peak period (3:30 PM to 5:30 PM) was used for calibration of the Base Model.

A summary of the SCATS detector count data and traffic survey data available for weekends along with the collection date is presented in Table 3-3.

Table 3-3: Available intersection count data for weekend

| $\#$ | Intersection | Type | Collection Date |
| :--- | :--- | :--- | :--- |
| 1 | Henry Lawson Drive/ Keys Parade | Signalised | $26-03-2022$ |
| 2 | Henry Lawson Drive/ Auld Avenue | Priority | $23-02-2021$ |
| 3 | Henry Lawson Drive/ Newbridge Road/ <br> Milperra Road | Signalised | $20-02-2021$ |
| 4 | Henry Lawson Drive/ Tower Road | Signalised | $20-02-2021$ |
| 5 | Henry Lawson Drive/ Bullecourt <br> Avenue | Signalised | $26-03-2022$ |
| 6 | Henry Lawson Drive/ Pozieres Avenue | Signalised | $26-03-2022$ |

The traffic count data in the weekend peak period from11:30 AM to 12:30 PM was used for calibration of the Base Model.

### 3.2 Traffic Signals

The signalised intersections in the study area are listed as follows and are visually presented in red colour on Figure $1-1$ showing the study area and key model intersections:

- Henry Lawson Drive/ Pozieres Avenue
- Henry Lawson Drive/ Bullecourt Avenue
- Henry Lawson Drive/ Keys Parade
- Henry Lawson Drive/ Newbridge Road / Milperra Road
- Henry Lawson Drive/ Tower Road
- Henry Lawson Drive/ Haig Avenue
- Milperra Road/ Murray Jones Drive
- Milperra Road/ Ashford Avenue

All signalised intersections above operate using SCATS and SCATS traffic signal data within the project area was sourced from TfNSW. The SCATS diagrams and phasing information was used to code intersections within the model.

The Aimsun model was developed with a 60-minute fixed time signal plans and phasing (e.g., 7.45 AM - 8.45 AM). The signal timing and phasing data was based on the SCATS IDM data provided by TfNSW. Note that as part of the calibration process, slight adjustments were made to some of the signal phases to replicate existing traffic conditions. These adjustments have been duly noted.

### 3.3 Travel Time Survey Data

The travel time data for one week from 27/02/2018 to 05/03/2018, was collected from HERE database ${ }^{2}$ along Henry Lawson Drive from Flinders Road to South-Western Motorway - M5 in both directions. The data used for travel time validation was extracted for the following time periods:

- Weekday AM Peak: 07:45 AM to 09:45 AM
- Weekday PM Peak: 03:30 PM to 05:30 PM
- Weekend Peak: 11:30 AM to 01:30 PM

[^1]

Figure 3-1: Travel Time Route and Sub-sections
The travel time data has been collected for four sub-route sections as shown in Figure 3-1 and listed as follows:

1. Henry Lawson Drive between Flinders Road and Haig Avenue
2. Henry Lawson Drive between Haig Avenue and Milperra Road
3. Henry Lawson Drive between Milperra Road and Bullecourt Avenue
4. Henry Lawson Drive between Bullecourt Avenue and M5

## Traffic Demand

### 4.1 Demand Estimation

Figure 4-1 describes the traffic demand estimation methodology. The matrix from the originally calibrated model has been used as the initial/prior matrix for demand estimation. Where the internal road network was removed, the zones were added together to retain the original trip distribution patterns. The internal trips between the zones that have been detached from the network have also been removed.

The demand profiling has been based on the originally profiled demand from the previous modelling exercise. This captured both the 15 -minute profiling and the heavy vehicle classification.

The profiled demand was manually adjusted where necessary to meet calibration and validation targets and ensure consistency between the observed and modelled traffic volumes.

## Traffic Counts

Figure 4-1: Traffic demand estimation methodology

### 4.2 Trip Balancing

The traffic survey data was analysed and used to develop traffic volume diagrams for every one-hour of the AM, PM and weekend peak periods. As the traffic data available are from different collection dates, discrepancies were identified between the in/out traffic flows at some locations. Therefore, the counts were carefully balanced to reflect a typical day in a week.

### 4.3 Zone Structure

There were 34 zones in the original Vissim base model of Henry Lawson Drive Stage 1B received from TfNSW. It is noted that few zones from Vissim model were aggregated and new zones were also added in the latest Aimsun model. The modified network resulted in 33 zones and the zone system for the model is aligned with the STFM model zones.
For Aimsun modelling of Stage 1B, the existing Aimsun model from Stage 1A was extended to include the section of Henry Lawson Drive between Keys Parade and South-Western Motorway (M-5). As a result, zone numbers used in Stage 1A was retained and additional centroids were given new zone numbers.

### 4.4 Heavy Vehicle Proportion

The proportion of heavy vehicles within the network were estimated from the observed data as the trip balancing process outlined in Section 4.2.

## HV Breakdown:

- 07:45-08:45 AM: 11.33\%
- 08:45-09:45 AM: 15.01\%
- 15:30-16:30 PM: 9.23\%
- 16:30-17:30 PM: 7.45\%
- 11:30 AM - 12:30 PM: $11.33 \%$
- 12:30 PM - 01:30 PM: 15.01\%

### 4.5 Demand Profiles

One-hour demands generated through departure adjustment procedure was then further manually profiled into 15-minute intervals. This was achieved by application of a factor to the one-hour matrices to generate a smooth profile. This led to the preparation of 15-minute demand matrices for AM, PM and weekend peak periods.

The heavy vehicle demand matrices were developed by applying a global factor as discussed in Section 4.4.
The modelled traffic demand profiles are as shown in Figure 4-2, Figure 4-3 and Figure 4-4 for AM, PM and weekend peak periods respectively.

Figure 4-2: Modelled AM Peak Traffic Demand Profiles from 07:45 to 09:45

Figure 4-3: Modelled PM Peak Traffic Demand Profiles from 15:30 to 17:30

Figure 4-4: Modelled Weekend Peak Traffic Demand Profiles from 11:30 to 13:30

## 5 Traffic Assignment

### 5.1 Path Assignment

Within Aimsun, the initial static assignment route choice was calculated using cost equations by taking into consideration section capacity and section travel times. The path assignment from the microsimulation experiment was then based on the set of initial paths generated as part of the static experiment. Figure 5-1 below summarises this path assignment process.

Figure 5-1: Path assignment process

### 5.2 Static OD Adjustment

The Frank-Wolfe assignment algorithm has been used to run the Static OD adjustment scenario. The matrix and trip length distribution elasticities values of 1 each were used for the assignment. The OD adjustment process adjusts the matrices to match the observed data input into the model as a Real Data Set (RDS) file. This resulted in adjusted hourly OD matrices for each of the vehicle classes.

### 5.3 Static Assignment

The static macroscopic experiment adopted the Frank-Wolfe assignment model for static equilibrium assignment, with the stopping criteria set at a relative gap (RGap) value of $0.1 \%$ and/ or a maximum of 100 iterations.

### 5.4 Dynamic Route Choice Parameters

The route choice parameters were adopted from Stage 1A model and were refined as part of the model calibration process. Few traffic management strategies were also used during calibration to reflect the traffic flow patterns. The key with route choice values is to achieve a robust model that can also adjust to changes in the network or demands. The route choice model settings are summarised in Table 5-1.

Table 5-1: Route choice model settings

| Parameter | Value |
| :--- | :---: |
| Behaviour: Two Lane Car Following Model | Enabled |
| Number of vehicles | 4 |
| Max. speed difference | $50 \mathrm{~km} / \mathrm{hr}$ |
| Max. distance | 100 m |
| Max. speed difference on ramp | $70 \mathrm{~km} / \mathrm{hr}$ |
| Speed difference setting | Relative |
| Queue entry speed | $1 \mathrm{~m} / \mathrm{s}$ |
| Queue exit speed | $4 \mathrm{~m} / \mathrm{s}$ |
| Micro Reaction Times |  |
| Simulation Step | 0.8 s |
| Reaction time at Stop | 1.20 s |
| Reaction time at Traffic Light | 1.6 s |
| Arrivals | Exponential |
| Global Arrivals |  |
| Dynamic Traffic Assignment |  |

| Parameter | Value |
| :--- | :---: |
| Cycle | $0: 15: 00$ |
| Number of Intervals | 3 |
| Attractiveness Weighting | 3 |
| User Defined Cost Weight | 1 |
| Use of O/D Routes and Path Assignment Results | $100 \%$ |
| Vehicles following O/D Routes | $100 \%$ |
| Vehicles following Path Assignment Results | Proportional |
| Route Choice Model | Disabled |
| Route Choice Model | 1 |
| Enroute | 3 |
| Initial K-SPs | 3 |
| Max Number to Keep | 3 |
| Max Number of Paths | 1 |
| Parameters |  |
| Alpha |  |

In model, two prominent route choices for traffic originating and destined to centroid 32 and 33 exists. The following option routes:

Route 1: via Henry Lawson Drive/ Bullecourt Avenue intersection.
Route 2: via Milperra Road/ Ashford Avenue intersection then on to Henry Lawson Drive.
During calibration, traffic management strategies such as forced turn were used to distribute origindestination based traffic on route 1 and route 2 . The traffic management strategies applied in base model are summarised in Table 5-2.

Table 5-2: Traffic management strategies adopted.

| Traffic management <br> strategy | O-D Pair | Route 1 | Route 2 |
| :--- | :---: | :---: | :---: |
| AM Period |  |  |  |
| Forced Turn | $5-32$ | $20 \%$ | $80 \%$ |
| Forced Turn | $32-9$ | $100 \%$ | $0 \%$ |
| Forced Turn | $23-5$ | $20 \%$ | $80 \%$ |
| Forced Turn | $32-9$ | $100 \%$ | $0 \%$ |
| PM Period |  |  |  |
| Forced Turn | $5-32$ | $35 \%$ | $65 \%$ |
| Forced Turn | $5-33$ | $35 \%$ | $65 \%$ |
| Forced Turn | $32-9$ | $100 \%$ | $0 \%$ |
| Forced Turn | $32-11$ | $100 \%$ | $0 \%$ |
| Forced turn | $32-15$ | $100 \%$ | $0 \%$ |
| Forced Turn | $32-31$ | $100 \%$ | $0 \%$ |
| Forced Turn | $32-5$ | $35 \%$ | $65 \%$ |
| Forced Turn | $33-5$ | $35 \%$ | $65 \%$ |
| Forced Turn | $9-32$ | $90 \%$ | $10 \%$ |
| Forced Turn | $11-32$ | $100 \%$ | $0 \%$ |
| Forced Turn | $15-32$ | $100 \%$ | $0 \%$ |
| Forced Turn | $31-32$ | $100 \%$ | $0 \%$ |
| Weekend Period |  |  |  |

| Traffic management <br> strategy | O-D Pair | Route 1 | Route 2 |
| :--- | :---: | :---: | :---: |
| Forced Turn | $5-32$ | $20 \%$ | $80 \%$ |
| Forced Turn | $32-9$ | $100 \%$ | $0 \%$ |
| Forced Turn | $23-5$ | $20 \%$ | $80 \%$ |
| Forced Turn | $32-9$ | $100 \%$ | $0 \%$ |

## 6 Base Model Calibration and Validation

The process of model calibration and validation is a highly iterative process which involves network verification and fine-adjustment of both appropriate model parameters and the origin-destination matrices. The aim of this process is to improve the ability of the model to reproduce observed vehicle / driver behaviour and the match between modelled and observed traffic movements.

Given the range of model parameters affecting vehicle / driver behaviour and iterative nature of calibration and validation, the process was carefully planned and managed

The model calibration and validation results are discussed in the following sections.

### 6.1 Model Stability

As recommended in the Modelling Guidelines, the microsimulation model results have been based on the average of five replications runs with different random seed values. These random seed values recommended in Modelling guidelines and adopted are 560, 28, 7771, 86524 and 2849 for all assessed peak periods.

The overall network statistics in terms of Vehicle Hours Travelled (VHT), Vehicle Kilometres Travelled (VKT), Average Delay, and Number of Vehicles (NV) for the modelled peak hours have been reported in the following sections. These statistics are generally considered representative of the model variability. Additionally, Coefficient of variance ( CoV ) has been calculated for the different statistics. CoV is a measure of variation between model runs and informs on the stability of each of the performance measures. Typically, a CoV within $5 \%$ is considered to have a good level of correlation between model runs and indicates that the model is stable.

### 6.1.1 AM Model Stability Results

Table 6-1 summarises the statistics based on five replications and provides the CoV for the AM peak. CoV results are shown to be than $5 \%$ which indicates that a good level of model stability has been achieved. Stability plots for VHT and VKT are also presented in Figure 6-1 and Figure 6-2 to graphically show the variability.

Table 6-1: Model Stability during AM Peak

| Scenario | Seed | VHT | $\begin{array}{c}\text { \%Diff } \\ \text { from } \\ \text { Average }\end{array}$ | VKT | $\begin{array}{c}\text { \%Diff } \\ \text { from } \\ \text { Average }\end{array}$ | $\begin{array}{c}\text { Number } \\ \text { of Vehicle } \\ \text { Outside } \\ \text { (NV) }\end{array}$ | $\begin{array}{c}\text { \%Diff } \\ \text { from }\end{array}$ |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Average |  |  |  |  |  |  |  |$]$

Figure 6-6: VHT (Vehicle Hour Travelled) across 5 seed runs during weekend peak

### 6.2 Model Calibration Criteria

The calibration criteria presented below are based on the Traffic Modelling Guidelines (Roads and Maritime Services, 2013):

- GEH < 5 minimum $85 \%$ of observations to be within these tolerance limits and $100 \%$ of observations to be within $\mathrm{GEH}<10$ tolerance limits
- Turn or link flows with GEH > 10 require explanation
- Plots of observed vs modelled hourly flows for all observations and to include lines showing GEH = 5 tolerance limits
- R2 value to be included with plots and to be $>0.9$
- Slope equation to be included with plots

The GEH statistic is used in the calibration of the traffic models to compare the differences between modelled and observed traffic flows. The GEH statistic is defined as:

$$
G E H=\sqrt{\frac{\left(V_{\text {observed }}-V_{\text {Modelled }}\right)^{2}}{0.5 *\left(V_{\text {Observed }}+V_{\text {Modelled }}\right)}}
$$

### 6.3 Traffic Count Calibration

This section summarises the comparisons between observed and modelled traffic counts during the peak hour periods. The information presents the microsimulation results achieved from comparing observed and modelled count data for each of the individual turns. A more detailed outline of the calibration results can be found in Appendix B.

### 6.3.1 AM Model Traffic Count Calibration Results

Table 6-4 and Table 6-5 summarise model calibration results for the weekday during AM peak hours (7:458:45 AM and 8:45-9:45 AM) for both light and heavy vehicles. Figure $6-7$ to Figure $6-10$ show the scatter plots between modelled and observed hourly flows for the above AM peak model periods, respectively.

- During 07:45-08:45 AM and 08:45-09:45 AM, 100 per cent of turn flows have GEH value of less than 10 for both light and heavy vehicles ( $\mathrm{GEH}<10$ ).
- 95.06\% (154 of 162) of all movements during 07:45-08:45 AM and 97.53\% (158 of 162) of all movements during 08:45-09:45 AM for light vehicles have GEH value of less than 5 ( $\mathrm{GEH}<5$ ).
- 92.59\% (150 of 162) of all movements during 07:45-08:45 AM and 93.21\% (151 of 162) of all movements during 08:45-09:45 AM for heavy vehicles have GEH value of less than $5(\mathrm{GEH}<5)$.
- These results are reinforced with a high $R^{2}$ value 0.994 and 0.993 for light vehicles and 0.937 and 0.942 for heavy vehicles, which demonstrates that a high level of calibration was achieved for the weekday AM peak period (07:45-08:45 AM and 08:45-09:45 AM).

Table 6-4 AM turn calibration statistic results for light vehicles

| Network Wide Calibration Criteria | 7:45-8:45 AM | 8:45-9:45 AM | Calibration |
| :---: | :---: | :---: | :---: |
| $85 \%$ of observations must have GEH < 5 | 154 (95.06\%) | 158 (97.53\%) | $\checkmark$ |
| $100 \%$ of observation must have GEH < 10 | 162 (100\%) | 162 (100\%) | $\checkmark$ |
| Total observations | 162 | 162 |  |

Table 6-5 AM turn calibration statistic results for heavy vehicles

| Network Wide Calibration <br> Criteria | $\mathbf{7 : 0 0 - 8 : 0 0 ~ A M ~}$ | 8:00-9:00 AM | Calibration |
| :--- | :---: | :---: | :---: |
| 85\% of observations must <br> have GEH $<5$ | $150(92.59 \%)$ | $151(93.21 \%)$ | $\boldsymbol{V}$ |
| $100 \%$ of observation must <br> have GEH $<10$ | $162(100 \%)$ | $162(100 \%)$ | $\boldsymbol{V}$ |
| Total observations | 162 | 162 |  |

Figure 6-10: 8:45-9:45 AM regression plots for heavy vehicles

### 6.3.2 PM Model Traffic Count Calibration Results

Table 6-6 and Table 6-7 summarise model calibration results for the weekday during PM peak hours (03:3004:30 PM and 04:30-05:30 PM) for both light and heavy vehicles. Figure 6-11 to Figure 6-14 show the scatter plots between modelled and observed hourly flows for the above PM peak model periods, respectively.

- During 03:30-04:30 PM and 04:30-05:30 PM, 100 per cent of turn flows have GEH value of less than 10 for both light and heavy vehicles ( $\mathrm{GEH}<10$ ).
- $98.15 \%$ (159 of 162) of all movements during PM peak for light vehicles have GEH value of less than 5 (GEH<5).
- $96.91 \%$ (157 of 162) of all movements during 03:30-04:30 PM and 97.53\% (158 of 162) of all movements during 04:30-005:30 PM for heavy vehicles have GEH value of less than 5 (GEH<5).
- These results are reinforced with a high $R^{2}$ value 0.993 and 0.991 for light vehicles and 0.943 and 0.931 for heavy vehicles, which demonstrates that a high level of calibration was achieved for the weekday PM peak period (3:30-4:30 PM and 4:30-5:30 PM).

Table 6-6 PM turn calibration statistic results for light vehicles

| Network Wide Calibration <br> Criteria | 3:30-4:30 PM | 4:30-5:30 PM | Calibration |
| :--- | :---: | :---: | :---: |
| $85 \%$ of observations must <br> have GEH < | $159(98.15 \%)$ | $159(98.15 \%)$ | $\boldsymbol{V}$ |
| $100 \%$ of observation must <br> have GEH $<10$ | $162(100 \%)$ | $162(100 \%)$ | $\boldsymbol{V}$ |
| Total observations | 162 | 162 |  |

Table 6-7 PM turn calibration statistic results for heavy vehicles

| Network Wide Calibration Criteria | 3:30-4:30 PM | 4:30-5:30 PM | Calibration |
| :---: | :---: | :---: | :---: |
| $85 \%$ of observations must have GEH < 5 | 157 (96.91\%) | 158 (97.53\%) | $\checkmark$ |
| $100 \%$ of observation must have GEH < 10 | 162 (100\%) | 162 (100\%) | $\checkmark$ |
| Total observations | 162 | 162 |  |

### 6.3.3 Weekend Model Traffic Count Calibration Results

Table 6-8 and Table 6-9 summarise model calibration results for the weekend peak hours (11:30 AM - 12:30 PM and 12:30 PM - 01:30 PM) for both light and heavy vehicles. Figure 6-15 to Figure 6-18 show the scatter plots between modelled and observed hourly flows for the above weekend peak model periods, respectively.

- During 11:30 AM - 12:30 PM and 12:30 PM - 01:30 PM, 100 per cent of turn flows have GEH value of less than 10 for both light and heavy vehicles (GEH <10).
- For light vehicles, 100\% of all movements during 11:30 AM-12:30 PM and 12:30 PM - 01:30 PM have GEH value of less than $5(\mathrm{GEH}<5)$.
- In case of heavy vehicles, 93.21\% (151 of 162) of all movements during 11:30 AM - 12:30 PM and $95.68 \%$ (155 of 162 ) of all movements during 12:30 PM - 01:30 PM have GEH value of less than 5 ( $\mathrm{GEH}<5$ ).
- These results are reinforced with a R² value 0.997 and 0.997 for light vehicles and 0.869 and 0.892 for heavy vehicles, which demonstrates that a good level of calibration was achieved for the weekend peak period (11:30 AM - 12:30 PM and 12:30 PM - 01:30 PM).

Table 6-8: Weekend turn calibration statistic results for light vehicles

| Network Wide Calibration <br> Criteria | 11:30 AM - 12:30 PM | 12:30 PM - 01:30 PM | Calibration |
| :--- | :---: | :---: | :---: |
| $85 \%$ of observations must <br> have GEH < 5 | $162(100 \%)$ | $162(100 \%)$ | $\boldsymbol{V}$ |
| $100 \%$ of observation must <br> have GEH $<10$ | $162(100 \%)$ | $162(100 \%)$ | $\boldsymbol{V}$ |
| Total observations | 162 | 162 |  |

Table 6-9: Weekend turn calibration statistic results for heavy vehicles

| Network Wide Calibration <br> Criteria | 11:30 AM - 12:30 PM | 12:30 PM - 01:30 PM | Calibration |
| :--- | :---: | :---: | :---: |
| 85\% of observations must <br> have GEH $<5$ | $151(93.21 \%)$ | $155(95.68 \%)$ | $\boldsymbol{V}$ |
| $100 \%$ of observation must <br> have GEH $<10$ | $162(100 \%)$ | $162(100 \%)$ | $\boldsymbol{V}$ |
| Total observations | 162 | 162 |  |

### 6.4 Model Validation

Model validation involves the comparison of observed and modelled traffic behaviour for datasets that are independent to the datasets used for the model calibration. Model validation is necessary to ensure that a model accurately represents an existing traffic situation and can be used with confidence to test alternatives.

### 6.4.1 Model Validation Criteria

Based on the Traffic Modelling Guidelines (Roads and Maritime, 2013), the average modelled journey time to be within 15 per cent or one minute (whichever is greater) of average observed journey time for full length of the route.

### 6.4.2 Network Parameter Modifications

As part of the travel time validation process, the following network parameters were modified from the TfNSW previously developed model and few network parameters were adopted for extension portion:

- During AM period
- The acceleration factor from Bullecourt Avenue to Keys Parade Northbound has been increased by 2 times, acceleration factor for south approach and east-bound approach to HLD/Bullecourt Avenue intersection has been increased by 3 and acceleration factor from HLD/ M-5 intersection to Fromelles Avenue has been increased by 1.5 .
- For Flinders Road to Milperra Road the acceleration factor has been increased by 2 times, however for the portion between north approach of Beale Street to Endeavour Road the acceleration factor has been increased by 3 times. Similarly, the acceleration factor for (2 lane section) North approach to tower Road has been increased by 3 times.
- The acceleration factor for South bound from Milperra to M-5 has been increased by 2 times except for the two-lane section between Milperra Road to Auld Avenue and Keys Parade to Raleigh Road.
- During PM period
- In Northbound, the acceleration factor from Pozieres Avenue to Milperra has been increased by 2 times except for the portion between Keys Parade to Auld Avenue. For south approach and East bound approach of Bullecourt/HLD intersection, the acceleration factor has been increased by 3 times.
- In South bound, the acceleration factor from Flinders Road to Milperra has been reduced by 0.5 times except for the portion between Haig Avenue to Georges golf course and Tower Road south bound approach for which acceleration factor has been reduced by 0.2 times.
- The acceleration factor for East bound and West bound approach for HLD/ Milperra intersection has been increased by 3 times. The acceleration factor for the reaming portion of West bound section on Newbridge Road and Milperra road has been increased by 2 times.
- During Weekend period
- The acceleration factor for northbound and southbound between M5 and Flinders Road has been increased by 5 times.
- For Milperra Road, an acceleration factor of 5 was used for both eastbound and westbound.
- Based on midblock survey conducted by Matrix in 2022, the section between M-5 and Bullecourt Avenue had an $85^{\text {th }}$ percentile speed of approximately $70 \mathrm{~km} / \mathrm{h}$. Therefore, attribute override was created to reflect the $85^{\text {th }}$ percentile speed for that section in the model for weekend.
The parameter changes on the AM, PM and weekend peak scenarios were added as Attribute Overrides.

### 6.4.3 Validation Results for AM Model

The modelled travel times along Henry Lawson Drive have been validated against HERE travel time data for two hours, 07:45-08:45 AM and 08:45-09:45 AM. It should be noted that traffic count data used for calibration purposes is from 2018 and 2022; however, travel time data used during the validation process was collected in 2018. These differences in data collection year may result in discrepancies between the surveyed data, which might impact modelled results.

Figure 6-19 to Figure 6-22 and Table 6-10 present travel time results for the morning peak. Overall, the modelled and HERE travel time data show a good correlation and fit within the $15 \%$ range or one minute for northbound section except for southbound section which has travel time difference of 1:33 minutes during 07:45-08:45 AM and travel time difference of $1: 50$ minutes during 08:45 to 09:45 AM. Based on the fact that calibration and validation data were obtained for different dates and that the total travel time difference is within two minutes for the entire corridor, it can be considered that modelled travel times are a good representation of what was observed on site.

Table 6-10: Travel Time Validation Northbound and Southbound during AM Peak

| Travel Route | Direction | Time | Observed (mm:ss) | Modelled (mm:ss) | Abs Diff (mm:ss) | Rel Diff \% | Result |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| M5-Flinders Road | Northbound | 07:45-08:45 AM | 08:26 | 08:20 | 00:06 | 1\% | PASS |
| M5-Flinders Road | Northbound | 08:45-09:45 AM | 10:43 | 09:56 | 00:47 | 7\% | PASS |
| Flinders Road-M5 | Southbound | 07:45-08:45 AM | 07:37 | 09:11 | 01:33 | 20\% | FAIL |
| Flinders Road-M5 | Southbound | 08:45-09:45 AM | 07:03 | 08:53 | 01:50 | 26\% | FAIL |
| Travel Time Criteria and measure |  | Criteria | Observed Total |  | Modelled Achieved | Achiev ed | Result |
| $\pm 15 \%$ or one minute (whichever is greater) of average of full length of routes |  | $\geq 95 \%$ of cases | 2 |  | 2 | 100\%* | PASS |

Figure 6-19: Travel time validation northbound 7:45-8:45 AM

Figure 6-20 Travel time validation northbound 8:45-9:45 AM

Figure 6-21: Travel time validation southbound 7:45-8:45 AM

Figure 6-22: Travel time validation southbound 8:45-9:45 AM

### 6.4.4 Validation Results for PM Model

The modelled travel times along Henry Lawson Drive have been validated against HERE travel time data for two hours, 03:30-04:30 PM and 04:30-05:30 PM. It should be noted that traffic count data used for calibration purposes is from 2018 and 2022; however, travel time data used during the validation process was collected in 2018. These differences in data collection year may result in discrepancies between the surveyed data, which might impact modelled results.

Figure 6-23 to Figure 6-26 and Table 6-11 present travel time results for the evening peak. Overall, the modelled and HERE travel time data show a good correlation and fit within the $15 \%$ range or one minute for all analysed sections, satisfying the validation criteria.

Table 6-11: Travel Time Validation Northbound and Southbound during PM Peak

| Travel Route | Direction | Time | Observed (mm:ss) | Modelled (mm:ss) | Abs Diff (mm:ss) | Rel Diff \% | Result |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| M5-Flinders Road | Northbound | 03:30-04:30 PM | 09:30 | 08:17 | 01:13 | 13\% | PASS |
| M5-Flinders Road | Northbound | 04:30-05:30 PM | 07:57 | 08:50 | 00:52 | -11\% | PASS |
| Flinders Road-M5 | Southbound | 03:30-04:30 PM | 11:15 | 10:23 | -00:52 | 8\% | PASS |
| Flinders Road-M5 | Southbound | 04:30-05:30 PM | 10:42 | 11:27 | -00:45 | -7\% | PASS |
| Travel Time Criteria and measure |  | Criteria | Observed Total |  | Modelled Achieved | Achieved | Result |
| $\pm 15 \%$ or one minute (whichever is greater) of average of full length of routes |  | $\geq 95 \%$ of cases | 2 |  | 2 | 100\%* | PASS |

Figure 6-23: Travel time validation northbound 3:30-4:30 PM

Figure 6-24: Travel time validation northbound 4:30-5:30 PM

Figure 6-25: Travel time validation southbound 3:30-4:30 PM

Figure 6-26: Travel time validation southbound 4:30-5:30 PM

### 6.4.5 Validation Results for Weekend Model

The Modelled travel times along Henry Lawson Drive have been validated against HERE travel time data for two hours, 11:30 AM - 12:30 PM and 12:30 PM - 01:30 PM. It should be noted that traffic count data used for calibration purposes is from 2021 and 2022; however, travel time data used during the validation process was collected in 2018. These differences in data collection year may result in discrepancies between the surveyed data, which might impact modelled results.

Figure 6-27 to Figure 6-30 and Table 6-12 present travel time results for the morning peak. Overall, the modelled and HERE travel time data show a correlation, however, not within the $15 \%$ range or one minute for the northbound and southbound sections. For the northbound, there is a travel time difference of 01:40 minutes during 11:30 AM - 12:30 PM and travel time difference of 1:15 minutes during 12:30 PM - 01:30 PM. In the case of southbound, there is a travel time difference of 01:34 minutes during 11:30 AM - 12:30 PM and travel time difference of 2:18 minutes during 12:30 PM - 01:30 PM.
Since the calibration and validation data were obtained for different dates and that the total travel time difference is within two minutes for the entire corridor, it can be considered that modelled travel times are a good representation of what was observed on site.

Table 6-12: Travel Time Validation Northbound and Southbound during AM Peak

| Travel Route | Direction | Observed <br> (mm:ss) | Modelled <br> (mm:ss) | Abs Diff <br> (mm:ss) | Rel Diff \% | Result |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| M5-Flinders <br> Road | Northbound | $11: 30$ AM-12:30 PM | $06: 10$ | $07: 50$ | $01: 40$ | $27 \%$ | FAIL |
| M5-Flinders <br> Road | Northbound | $12: 30$ PM-01:30 PM | $06: 47$ | $08: 01$ | $01: 15$ | $18 \%$ | FAIL |
| Flinders Road- <br> M5 | Southbound | $11: 30$ AM-12:30 PM | $07: 01$ | $08: 35$ | $01: 34$ | $22 \%$ | FAIL |
| Flinders Road- <br> M5 | Southbound | $12: 30$ PM-01:30 PM | $06: 18$ | $08: 36$ | $02: 18$ | $36 \%$ | PASS |
| Travel Time Criteria and measure | Criteria | Observed Total | Modelled <br> Achieved | Achieved | Result |  |  |
| $\pm 15 \%$ or one minute (whichever <br> is greater) <br> of average of full length of routes | $\geq 95 \%$ of cases |  | 2 | 0 | $0 \%$ | FAIL |  |

Figure 6-30: Travel time validation southbound 12:30 PM - 01:30 PM

### 6.5 Intersection Level of Service

This section provides simulated Level of Services (LOS) across the modelled time periods at 15 key intersections in the modelled area. Detailed results are presented in Appendix C.

The key indicator of intersection performance level of service (LOS) is delay, where results are ranked on a scale from A to F as shown in Table 6-13 (Traffic Modelling Guidelines, 2013). As intersections become more congested, the delay increases, reducing the intersection LOS towards F. It should be noted that LOS F starts when the average delay reaches $70 \mathrm{sec} / \mathrm{veh}$ and does not register as anything worse than LOS F even though the delay may increase to two or three times this value. For traffic signals, the average movement delay and level of service over all movements is considered.

Table 6-13 Level of service criteria in accordance with RMS Traffic Modelling Guidelines

| Level of <br> service | Average delay per <br> vehicle (s) | Traffic Signal, Roundabouts | Give way and stop signs |
| :---: | :---: | :---: | :---: |
| A | $<14$ | Good operation | Good operation |
| B | 15 to 28 | Good with acceptable delays \& spare capacity | Acceptable delays \& spare capacity |
| C | 29 to 42 | Satisfactory | Satisfactory, but accident study <br> required |
| D | 43 to 56 | Operating near capacity | Near capacity \& accident study <br> required |
| E | 57 to 70 | $>70$ | At capacity, at signals, incidents will cause |
| excessive delays | At capacity, requires other control <br> mode |  |  |
| F |  | Unsatisfactory and requires additional capacity | Unsatisfactory and requires additional <br> capacity |

### 6.5.1 AM Model Intersection Level of Service

The LOS has been analysed during 07:45-08:45 AM and 08:45-09:45 AM respectively, at 15 key intersections. Table 6-14 presents a LOS summary of these 15 key intersections during the weekday AM Peak period, whilst a detailed output is presented in Appendix C.

Table 6-14 AM Peak Intersection Level of Service Summary

| ID | Intersection | 07:45-08:45 AM |  |  | 08:45-09:45 AM <br> Intersection |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |  |  |  |
|  |  | Volume | Delay (s) | LOS | Volume | Delay (s) | LOS |
| 1 | HLD/ Haig Avenue | 2,404 | 33 | C | 2,142 | 34 | C |
| 2 | HLD / Tower Road | 2,833 | 26 | B | 2,601 | 55 | D |
| 3 | HLD / Milperra Road | 5,771 | 228 | F | 5,556 | 591 | F |
| 4 | HLD/ Auld Avenue | 2,101 | 6 | A | 1,975 | 6 | A |
| 5 | HLD / Keys Parade | 1,995 | 12 | A | 1,992 | 16 | B |
| 6 | HLD/ Raleigh Road | 1,985 | 5 | A | 1,742 | 5 | A |
| 7 | HLD/ Ruthven Avenue | 1,867 | 3 | A | 1,655 | 3 | A |
| 8 | HLD/ Whittle Avenue | 1,880 | 3 | A | 1,647 | 3 | A |
| 9 | HLD/ Amiens Avenue | 1,919 | 4 | A | 1,694 | 3 | A |
| 10 | HLD/ Bullecourt Avenue | 2,298 | 25 | B | 2,030 | 25 | B |
| 11 | HLD/ Fromelles Avenue | 2,018 | 8 | A | 1,726 | 7 | A |
| 12 | HL / Hermies Avenue | 2,043 | 4 | A | 1,757 | 3 | A |
| 13 | HLD/ Pozieres Avenue | 2,279 | 17 | B | 2,004 | 17 | B |
| 14 | Murray Jones Drive/ Milperra Road | 2,976 | 4 | A | 2,883 | 19 | B |
| 15 | Ashford Avenue / Milperra Road | 3,382 | 35 | C | 3,282 | 52 | D |

- Henry Lawson Drive / Keys Parade/ Flower power:
- In the first AM peak hour from 07:45 AM to 08:45 AM, the intersection operates at LOS A with an intersection delay of 12 seconds, and in the second peak hour from 08:45 AM to 09:45 AM, the intersection operates at LOS B with an intersection delay of 16 seconds indicating a good level of service.
- The demand on Henry Lawson Drive northbound and southbound is high. Figure 6-31 presents the typical intersection operation at Henry Lawson Drive / Keys Parade/Flower power intersection.

## 08:32:19

Figure 6-31 : Henry Lawson Drive / Keys Parade / Flower power Weekday AM peak operation screenshot.

## - HLD / Bullecourt Avenue:

- During the AM peak period from 7:45 AM to 9:45 AM, the intersection operates at LOS B with intersection delay of 25 seconds in both peak hours, indicating good level of performance. The traffic demand on northbound, southbound, and eastbound (turning into Bullecourt Avenue) is high which creates a small and short-lasting queue at each approach of the intersection. The model suggests that the queues on all approaches mostly get dissipated during green time for that approach. The users going northbound to Henry Lawson Drive from Bullecourt Avenue in the east approach face the most delay. The existing delay on Bullecourt Avenue is 68 seconds.
- The Figure 6-32 presents Henry Lawson Drive/ Bullecourt Avenue intersection operation during AM peak in comparison to google typical traffic volume view during AM peak on weekday. Upon comparison, it is seen that the short queues at intersection approaches were captured.

## 08:23:47

Figure 6-32 : Henry Lawson Drive/ Bullecourt Ave Weekday AM Peak Intersection operation screenshot

- HLD / Pozieres Avenue:
- During AM peak period, the intersection operates at LOS B with intersection delay of 17 seconds in both hours. The model suggests the users turning from Pozieres Avenue into Henry Lawson Drive may face some delay. The delay for users from Pozieres Avenue is 68 seconds.

### 6.5.2 PM Model Intersection Level of Service

The LOS has been analysed during 3:30-4:30 PM and 4:30-5:30 PM respectively, at 15 key intersections. Table 6-15 presents a LOS summary of these 15 key intersections during the weekday PM Peak period while a detailed output is presented in Appendix C.

Table 6-15: PM Peak Intersection Level of Service Summary

| ID | Intersection | 3:30-4:30 PM |  |  | 4:30-5:30 PM |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Intersection |  |  | Intersection |  |  |
|  |  | Volume | Delay | LOS | Volume | Delay | LOS |
| 1 | HLD/ Haig Avenue | 2,408 | 55 | D | 2,476 | 57 | E |
| 2 | HLD / Tower Road | 2,976 | 35 | C | 3,135 | 37 | C |
| 3 | HLD / Milperra Road | 6,545 | 237 | F | 6,871 | 469 | F |
| 4 | HLD/ Auld Avenue | 2,221 | 7 | A | 2,363 | 8 | A |
| 5 | HLD / Keys Parade | 2,209 | 14 | A | 2,358 | 17 | B |
| 6 | HLD/ Raleigh Road | 2,033 | 5 | A | 2,052 | 5 | A |
| 7 | HLD/ Ruthven Avenue | 1,939 | 3 | A | 1,930 | 3 | A |
| 8 | HLD/ Whittle Avenue | 1,959 | 3 | A | 1,943 | 3 | A |
| 9 | HLD/ Amiens Avenue | 2,015 | 3 | A | 1,989 | 3 | A |
| 10 | HLD/ Bullecourt Avenue | 2,355 | 45 | D | 2,342 | 38 | C |
| 11 | HLD/ Fromelles Avenue | 1,972 | 6 | A | 1,982 | 5 | A |
| 12 | HL / Hermies Avenue | 2,109 | 5 | A | 2,087 | 4 | A |
| 13 | HLD/ Pozieres Avenue | 2,272 | 12 | A | 2,253 | 11 | A |
| 14 | Murray Jones Drive/ Milperra Road | 3,578 | 6 | A | 3,342 | 16 | B |
| 15 | Ashford Avenue / Milperra Road | 4,019 | 18 | B | 3,698 | 20 | B |

- HLD / Keys Parade/Flower power:
- During the PM peak period from 03:30 PM to 4:30 PM, the intersection operates at LOS A with an intersection delay of 14 seconds and in the second peak hour from 04:30 PM to 05:30 PM, the intersection operates at LOS B with an intersection delay of 17 seconds indicating a good level of service.
- During PM, the demand for traffic turning from Henry Lawson Drive into Flower Power Access and demand for traffic turning from Flower Power Access into Henry Lawson Drive is higher. Also, the demand on Henry Lawson Drive northbound and southbound is high. The delay for Flower Power Access in the east approach from 03:30 PM to 4:30 PM is 44 seconds and for 04:30 PM to 05:30 PM is 43 seconds. Figure $6-33$ presents the intersection operation at Henry Lawson Drive/ Keys Parade/ Flower power intersection.

## 15:48:52

Figure 6-33: Henry Lawson Drive / Keys Parade/Flower power Weekday PM peak operation screenshot.

- HLD / Bullecourt Avenue:
- During the first PM peak hour from 03:30 PM to 04:30 PM, the intersection operates at LOS D with an intersection delay of 45 seconds and in the second peak hour from 04:30 PM to 05:30 PM, the intersection operates at an improved LOS C with an intersection delay of 38 seconds.
- In the PM peak period, the demand from Bullecourt Avenue turning into Henry Lawson Drive increases considerably resulting in congestion on the approach. The average delay on Bullecourt Avenue east approach from 03:30 PM to 04:30 PM is 112 seconds and from 04:30 PM to 05:30 PM is 92 seconds. The high delay on Bullecourt Avenue approach leads to comparatively higher overall intersection delay and hence an overall LOS D. The Figure 6-34 presents the operation of Henry Lawson Drive/ Bullecourt Avenue intersection in PM peak in comparison to google typical traffic view during PM peak on a typical weekday. Upon comparison of images, it is seen that the increased length of queues at Bullecourt Avenue approach were captured.

16:31:09

Figure 6-34: Henry Lawson Drive/ Bullecourt Ave Weekday PM Peak Intersection operation screenshot

- HLD / Pozieres Avenue:
_ During the PM peak period from 03:30 PM to 05:30 PM, the intersection operates at LOS A indicating a good level of performance. The model suggests the users turning from Pozieres Avenue into Henry Lawson Drive may face some delay. The delay for vehicles from Pozieres Avenue is 51 seconds.

### 6.5.3 Weekend Model Intersection Level of Service

The LOS has been analysed during 11:30 AM-12:30 PM and 12:30 PM-01:30 PM respectively, at 15 key intersections. Table 6-16 presents a LOS summary of these 15 key intersections during the weekend peak period, whilst a detailed output is presented in Appendix C.

Table 6-16: Weekend Peak Intersection Level of Service Summary

| ID | Intersection | 11:30 AM - 12:30 PM |  |  | 12:30 PM - 01:30 PM |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Intersection |  |  | Intersection |  |  |
|  |  | Volume | Delay (s) | LOS | Volume | Delay (s) | LOS |
| 1 | HLD/ Haig Avenue | 2,339 | 32 | C | 2,407 | 34 | C |
| 2 | HLD / Tower Road | 2,779 | 22 | B | 2,880 | 25 | B |
| 3 | HLD / Milperra Road | 5,964 | 55 | D | 5,858 | 102 | F |
| 4 | HLD/ Auld Avenue | 2,250 | 6 | A | 1,997 | 5 | A |
| 5 | HLD / Keys Parade | 2,303 | 17 | B | 2,075 | 17 | B |
| 6 | HLD/ Raleigh Road | 1,706 | 3 | A | 1,532 | 3 | A |
| 7 | HLD/ Ruthven Avenue | 1,589 | 3 | A | 1,445 | 2 | A |
| 8 | HLD/ Whittle Avenue | 1,585 | 3 | A | 1,441 | 3 | A |
| 9 | HLD/ Amiens Avenue | 1,613 | 3 | A | 1,468 | 2 | A |
| 10 | HLD/ Bullecourt Avenue | 1,792 | 24 | B | 1,601 | 23 | B |
| 11 | HLD/ Fromelles Avenue | 1,673 | 5 | A | 1,625 | 5 | A |
| 12 | HL / Hermies Avenue | 1,931 | 4 | A | 1,785 | 4 | A |
| 13 | HLD/ Pozieres Avenue | 2,111 | 13 | A | 1,949 | 12 | A |
| 14 | Murray Jones Drive/ Milperra Road | 3,179 | 3 | A | 3,128 | 4 | A |
| 15 | Ashford Avenue / Milperra Road | 3,482 | 23 | B | 3,449 | 52 | D |

- Henry Lawson Drive / Keys Parade / Flower power:
- In the first weekend peak hour from 11:30 AM - 12:30 PM, the intersection operates at LOS B with an intersection delay of 17 seconds, and in the second peak hour from 12:30 PM - 01:30 PM, the intersection operates at LOS B with an intersection delay of 17 seconds indicating a good level of service.
- HLD / Bullecourt Avenue:
- During the weekend peak period from 11:30 AM - 01:30 PM, the intersection operates at LOS B in both peak hours, indicating a good level of performance. The traffic going northbound, southbound, and eastbound (turning into Bullecourt Avenue) creates a small and short-lasting queue at each approach of the intersection. The model suggests that the queues on all approaches mostly get dissipated during green time for that approach. The users going northbound to Henry Lawson Drive from Bullecourt Avenue in the east approach face the most delay. The existing delay on Bullecourt Avenue (east approach is) is 61 seconds.
- HLD / Pozieres Avenue:
- During weekend peak period, the intersection operates at LOS A in both hours. The model suggests the users turning from Pozieres Avenue into Henry Lawson Drive may face some delay. The delay for users from Pozieres Avenue is 59 seconds.

## 7 Summary and Conclusions

Aurecon was engaged by TfNSW to develop a microsimulation corridor model of Henry Lawson Drive upgrade - Stage 1 B area. This model is intended to be used to analyse potential future road network upgrade options being investigated for the area to relieve congestion and improve capacity. The model has been developed in Aimsun and calibrated to 2022 traffic conditions.

This report has been prepared to document the Base Model calibration and validation outcomes during AM, PM and weekend peak periods. The Base Model calibration and validation results along with observation of the model runs indicate that the model shows a good representation of the 2022 traffic conditions.

In summary, the Base Model adheres to all the criteria mandated by the Traffic Modelling Guidelines (Roads and Maritime, 2013) for calibration and validation, except during the weekend peak period where validation criteria were not satisfied. However, since the calibration and validation data were obtained for different years and that the total travel time difference is within two minutes for the entire corridor, it can be considered that modelled travel times are a good representation of what was observed on site.

The model stability is consistent across all chosen 5 seed runs.
Overall, the model is representative of the existing traffic conditions within the study area and is therefore considered fit for purpose to be used as the basis for option analysis.

## Appendix A: Typical Traffic volume on HLD Weekday PM period.

4:15 PM

## Appendix B: Model Calibration results.

GEH
Geoffrey E. Havers; the GEH Statistic is a formula used in traffic modelling to compare two sets of traffic volume data.

$$
G E H=\sqrt{\frac{2 *(\text { Observed }- \text { Modelled })^{2}}{(\text { Observed }+ \text { Modelled })}}
$$

## 1 Introduction

### 1.1 Background

Aurecon was commissioned by Transport for NSW (TfNSW) to deliver the Concept Design Services for Henry Lawson Drive upgrade Stage 1B. For traffic assessment, Aurecon developed a 2022 Base Model, undertook a calibration and validation exercise to ensure that the model is fit-for-purpose and can be used for future option evaluation. The methodology and parameters adopted for the Base model are aligned to the TfNSW Traffic Modelling Guidelines (Modelling Guidelines).

The options modelling will enable TfNSW to test different combinations of upgrades to determine the best possible option to implement on the network to improve network performance.

This report outlines the steps undertaken in the development of the future year model options including demand development, network coding and results.

### 1.2 Project Background

The upgrade would be carried out in four stages (Stages 1A, 1B, 2 and 3 ).
As part of the option assessment of the Henry Lawson Drive Stage 1A Upgrade - proposed to occur along the Henry Lawson Drive between Tower Road and Keys Parade, Aurecon has developed an Aimsun microsimulation traffic model covering 7.5 km of the route corridor, refer to HLDS1A-AURC-NWW-TM-RPT000001. The option modelling has been undertaken for 2026 and 2036 years, which are in-line with the proposed upgrade stages of Henry Lawson Drive as detailed in the technical memorandum HLDS1A-AURC-NWW-TP-MEM-000004.

This project, Henry Lawson Drive Stage 1B involves upgrade of Henry Lawson Drive along a 1.8-kilometre section between the Keys Parade and the approach to the M5 Motorway. The upgrade of key intersections and widening of Henry Lawson Drive would improve traffic capacity, decrease travel time, and enhance driver safety.

### 1.2.1 Objectives

The main objective of this report is to document the development of future scenarios and assess their performance.

The project study area covers the Henry Lawson Drive between Hume Highway and M5 Motorway as shown in Figure 1-1 below.

Figure 1-1: Henry Lawson Drive Stage 1B model study area

### 1.3 Base Model Overview

The Base Model was developed in Aimsun version 20.0.3 and calibrated to 2022 Weekday AM, PM and weekend peak traffic conditions.

The model study area covers the Henry Lawson Drive, located along the border of Hume Highway, Ashford Avenue, Bullecourt Avenue and Southwestern Motorway. The study area and the key intersections are shown in Figure 1-1.

Based on the analysis and in line with the collected data, it was identified that the Weekday AM peak period occurred from 07:45 AM to 09:45 AM, the PM peak period occurred from 03:30 PM to 05:30 PM and the weekend peak period was from 11:30 AM to 01:30 PM. A two hour model with an additional one hour warmup period was developed for AM, PM and weekend peak periods.

The Base Model satisfies the calibration and validation criteria such as hourly GEH counts, R squared values, and travel times as specified in the TfNSW Traffic Modelling Guidelines (Roads and Maritime Services). Overall, the model is representative of 2022 traffic conditions within the study area and is therefore considered fit for purpose to be used as the basis for option analysis.

The approved Base Model calibration and validation report for Henry Lawson Drive Stage-1B is presented in Appendix A. The report describes the procedure undertaken for development of the Base Model, including data analysis, network coding and results from model calibration and validation.

## 2 Future Year Network

### 2.1 Model Years

The option modelling has been undertaken for 2031 and 2041 years, which are in-line with the proposed upgrade stages of the Henry Lawson Drive Stage 1B.

### 2.2 Do-Minimum Scenario

The Do-Minimum scenario includes all committed projects in the Henry Lawson Drive study area. These proposed projects are detailed overpage.

Henry Lawson Drive/ Keys Parade/ Flower Power intersection upgrade: Figure 2-1 presents the proposed layout of the intersection. This includes the provision of access to proposed Riverlands Development on the west.

Figure 2-1: Henry Lawson Drive/ Keys Parade intersection upgrade
Georges Hall intersection Upgrade: Figure 2-2 presents the layout of the proposed intersection upgrades along this section of Henry Lawson Drive. These upgrades are described as follows:

- Use of the existing shoulder between the Endeavour Road and Rabaul Road to construct an additional southbound lane
- The extension of the Henry Lawson Drive southbound left-most exit leg to 100 m south of the Rabaul Road
- The ban of the existing northbound right turn from Henry Lawson Drive to Rabaul Road

Figure 2-2 Georges Hall Intersections Upgrade

Milperra Road/ Murray Jones Drive intersection upgrade: Figure 2-3 presents the proposed layout of the intersection. The intersection upgrades are described as follows:

- The creation of an additional right turn bay on the Milperra Road westbound to the Murray Jones Drive (75m)
- The widening of the Murray Jones Drive entry and exit leg to accommodate two full lanes.
- The creation of an additional left turn bay on the Milperra Road eastbound to the Murray Jones Drive (60m)

Figure 2-3:Milperra Road/ Murray Jones Drive intersection upgrade
Henry Lawson Drive/ Tower Road intersection upgrade: Figure 2-4 presents the proposed layout of the intersection alongside a screenshot of the intersection coding in Aimsun. The intersection upgrades are described as follows:

- The creation of an additional 100 m right turn bay on the south approach to the Tower Road.
- The extension of the left-most exit leg on the north approach from 60 m to 180 m .
- The widening of the Tower Road to accommodate dual right turn lanes and a left turn slip lane of 40 m .
- The provision of a pedestrian crossing across the south-east slip lane.
- The provision of a signalised pedestrian crossing across the Tower Road.
- The widening of the north approach to create a 60 m left turn bay to the Tower Road and extension of the adjacent through lane from 105 m to 180 m .

Figure 2-4: Henry Lawson Drive/ Tower Road intersection upgrade

Henry Lawson Drive / Milperra Road / Newbridge Road intersection Upgrade: Figure 2-5 presents the proposed layout of the intersection alongside a screenshot of the intersection coding in Aimsun. The intersection upgrades are described as follows:

- Extension of the dual right turn bays on the northern approach, from 85 m and 160 m to 220 m and 240m respectively.
- Widening of the northern approach to create a third straight through lane of 240 m and a left turn slip lane of 150 m .
- Creation of an additional right turn bay on the southern approach onto Milperra Road of 160 m and lengthening the existing right turn bay from 55 m to 170 m .
- Extension of the left turn slip lanes on the southern approach, from 60 m and 120 m to 150 m and 190m respectively.
- Widening of the exit leg on the southern approach to include two full lanes and a short lane of 200 m .
- Conversion of the existing bus short lane on Milperra Road to a full lane for general traffic.
- Creation of an additional right turn lane on Milperra Road of 200m.
- Extension of the left turn slip lane on the eastern approach, from 50 m to 130 m .
- Creation of an additional right turn bay on Newbridge Road of 30 m .

Figure 2-5: Henry Lawson Drive / Milperra Road / Newbridge Road Intersection Upgrade - Proposed drawing (top), Aimsun Model screenshot (bottom)

### 2.3 Option Scenario

The Option Scenario is a combination of the Henry Lawson Drive Stage 1A and Stage 1B upgrades. The Stage 1A upgrades are detailed in the technical memorandum HLDS1A-AURC-NWW-TP-MEM-000004. In this report, the Stage 1B upgrades are discussed in detail:

Widening of the Henry Lawson Drive section from the Keys Parade and the approach to M5 motorway to two lanes: The section between the Keys Parade to the approach of M5 motorway is proposed to be widened to four lanes with two lanes on each side. The Figure 2-6 presents the proposed section between the Keys Parade and Bullecourt Avenue and the Figure 2-7 presents the proposed section between the Bullecourt Avenue and approach to M5 Motorway. The upgrades are described as follows:

- All unsignalised intersections along this section are proposed to be a "left-in and left-out" to Henry Lawson Drive. The Connections of the Ruthven Avenue, Whittle Avenue, Amiens Avenue, Ganmain crescent, Fromelles Avenue and Hermies Avenue to the Henry Lawson Drive will be a "left-in and leftout".
- The Raleigh Road/ HLD intersection will be removed and a Link Road connection is proposed to connect the Raleigh Road to the Keys Parade. This Link Road will provide access to traffic coming from the Raleigh Road to the Henry Lawson Drive via Keys Parade and vice vera.
- Upgrades to the existing signalised intersections of Keys Parade/ HLD, Bullecourt Avenue/ HLD and Pozieres Avenue/ HLD are also proposed in Option Scenario and are discussed separately in this section.

Figure 2-6: Widening of Henry Lawson Drive between Keys Parade and Bullecourt Avenue

Figure 2-7: Widening of Henry Lawson Drive between Bullecourt Avenue and approach of M5 motorway

Henry Lawson Drive/ Keys Parade intersection upgrade and a Link Road connection between Auld Avenue and Keys Parade: The Figure $2-8$ presents the proposed layout of the Keys Parade/ HLD intersection in Aimsun. The intersection upgrades are described as follows:

- The creation of a left turn slip lane from the south approach on the Henry Lawson Drive to the Keys Parade.
- The widening of south approach of the Henry Lawson Drive to accommodate two through lanes and a right turn lane for vehicles turning to the Flower Power Access.
- The creation of connection between the Auld Avenue and Keys Parade.

Figure 2-8: Upgrades to Henry Lawson Drive/ Keys Parade/ Flower Power intersection
Henry Lawson Drive/ Bullecourt Avenue intersection upgrade: The Figure 2-9 presents the proposed layout of the intersection alongside a screenshot of the intersection coding in Aimsun. The intersection upgrades are described as follows:

- The widening of the north approach to accommodate a 40 m left turn lane from the Henry Lawson Drive to the Bullecourt Avenue.
- The widening of 80 m length of the south approach to accommodate two through lanes continuing northbound and two right turn lanes for vehicle movement from the Henry Lawson Drive to the Bullecourt Avenue.
- The widening of the Bullecourt Avenue approach from the Fleurbaix Avenue to the Henry Lawson Drive intersection to accommodate three lanes.
- The creation of a left turn slip lane to the Henry Lawson Drive from the Bullecourt Avenue.

Figure 2-9: Upgrades to Henry Lawson Drive/ Bullecourt Avenue intersection
Henry Lawson Drive/ Pozieres Avenue upgrade: The Figure 2-10 presents the proposed layout of the intersection in Aimsun. The intersection upgrades are described as follows:

- The widening of the south approach to accommodate a 60 m left turn lane from the Henry Lawson Drive to the Pozieres Avenue.
- The widening of the north approach to three lanes for 130 m length in order to increase the capacity for right turn lane from the Henry Lawson Drive to the Pozieres Ave.
- The use of solid line on the north approach for the left- most lane from the Hermies Avenue to the Pozieres Avenue.

Figure 2-10: Upgrades to Henry Lawson Drive/ Pozieres Avenue intersection

### 2.4 Signal control

Due to the intersection layout changes and travel demand growth in 2031 and 2041, signal phasing and timings for all signalised intersections in the study area are also required to be updated.

### 2.5 Modelled Future Network Scenarios

Table 2-1 summarises the two scenarios that were developed and reported as part of this assessment.
Table 2-1: Future Scenarios Modelled

| Scenario | Year | Road Network |
| :---: | :---: | :---: |

## $3 \quad$ Future Traffic Demand Development

The traffic demands used for the future year models have been developed from the 2021, 2031 and 2041 STFM sub-area matrices and link volume plots provided by TfNSW. The STFM data was provided for 2-hour AM and PM peak weekday periods.

As an example, the general methodology adopted to develop 2031 weekday AM, PM and weekend demands is explained in the following steps:

1. The STFM matrices were disaggregated to align with the Aimsun zone structure.
2. The per origin-destination pair cell difference between the 2021 and 2031 STFM matrices was initially calculated. This led to the calculation of overall Origin and Destination growth rate between the 2021 and 2031 STFM matrices.
3. After comparing several different growth methods, an origin percentage growth method was adopted as this resulted in a closer overall demand growth rate as STFM. The percentage growth of the zone origin totals between the STFM matrices was used to grow the 2022 Aimsun origin/ destination pairs to a 2031 future year level for the peak period.

The same approach has been adopted for the year 2041.
In the absence of STFM data for weekend model, the percentage growth of the zone origin totals between the STFM matrices in the AM model was used to grow the 2022 weekend origin/ destination pairs to a 2031 and 2041 future demands.
Some assumptions made in the process are explained in the following sections.

### 3.1 Growth Rates for Zones not reflected in STFM

A link volume plot of 2031 AM peak STFM Matrix has been presented in Figure 3-1. The corresponding subarea network plot extracted from the STFM is presented along with the existing Aimsun zone structure in Figure 3-2.

Figure 3-1: STFM Link Volume Plot for AM peak period from 07:00 AM to 09:00 AM

Figure 3-2: Aimsun Zoning Structure (left) STFM Sub Area Network Zoning Structure (right)

Being of strategic nature, STFM does not represent the smaller zones used in the microsimulation model. In these cases, some assumptions have been made on estimating growth rate for these zones.
Case 1: For the zones that are in close proximity to the STFM Zones, the growth rate of the corresponding STFM zone was applied. Such examples include zones 12 and 13 for which the STFM growth rate for zone 11 was adopted.

Case 2: For other zones a nominal per annum growth rate of $1 \%$ was assumed. These include zones 2, 4, 6, $7,10,13,14,19,21,22,34$ and 35.

### 3.2 Growth rates for Zones with Significant Future Development

In some cases, the calculated growth rate was significantly high compared to the Base case, indicating a new development in the area. These zones include:

- Zones 15,16: Airport precinct development zones
- Zone 3: Riverlands residential township development

In the case of zones 15 and 16, the STFM future demand was used by applying the trip distribution from the calibrated Base model.

The Zone 3 on the other hand had no demand in the Base case as there is no existing development. In this case, the STFM generation and distribution were adopted. The temporal profiling was then undertaken by applying the 2021 global matrix profiles.

### 3.3 Negative Growth

In cases where the origin-destination pair cell difference between the 2021 and 2031 STFM matrices was a negative number, the 2022 demand was assumed conservatively.

### 3.4 Option Scenario

As detailed in Section 2, the Future Option Case scenario assumes a left-in left-out layout for the intersections of Auld Avenue/ HLD, Ruthven Avenue/ HLD, Whittle Avenue/ HLD, Amiens Avenue/ HLD, Ganmain Crescent/ Fromelles Avenue/ HLD and Hermies Avenue/ HLD. The Raleigh Road/ HLD intersection is removed, and a Link Road connection is added to connect the Raleigh Road to the Keys Parade, in addition to the Link Road connection between Auld Avenue and Keys Parade.

Unlike Do-Minimum, where right turn movements are possible from/ to the Auld Avenue, Raleigh Road, Ruthven Avenue, Whittle Avenue, Amiens Avenue, Ganmain Crescent, Fromelles Avenue and Hermies Avenue, the Option Scenario restricts these movements. In Option Scenario, however, all traffic impacted by the restricted movements have been re-allocated to the appropriate detour in the model.

## 4 Option Modelling Results

The modelling results have been presented in the form of overall network statistics, corridor travel time and key intersection delays along with the Level of Service (LOS). This section presents the overall results with a detailed discussion and assessment of options in 2031 and 2041 for the AM, PM and weekend peak periods.

It is important to note that the number of incomplete trips and latent demand are higher for scenarios in 2041 in comparison to 2031, which may result in improved network performance and travel time in some cases for 2041 scenarios. However, this increase in incomplete trips and latent demand in 2041 is consistent across both Do-Minimum and Option scenarios. So, the comparison between both scenarios is not impacted.

### 4.1 Overall Network Performance

The network-wide model statistics were extracted from the weekday AM, PM and the weekend scenario models to establish an overall network performance. Figure 4-1 presents the road network extent modelled for Henry Lawson Drive Stage 1B.

Table 4-1, Table 4-2 and Table 4-3 show overall network performance during the AM peak, PM peak and weekend peak in 2031 and 2041. The Option Scenario is expected to operate with a slightly better performance in comparison to the Do-Minimum in 2031 and 2041 peak periods.

Note that the incomplete trips are the addition of latent demand, vehicles lost inside, vehicles lost outside, vehicles inside and missing turns.

Appendix C presents the location and extent of the latent demand recorded for 2031 and 2041 years, for all scenarios during the weekday AM, PM and the weekend peak periods.

### 4.2 Travel Time results

The travel time statistics have been analysed for the following four sections along Henry Lawson Drive illustrated in Figure 4-2.

1. Henry Lawson Drive between Flinders Road and Haig Avenue
2. Henry Lawson Drive between Haig Avenue and Milperra Road
3. Henry Lawson Drive between Milperra Road and Bullecourt Avenue
4. Henry Lawson Drive between Bullecourt Avenue and M5

Figure 4-2: Travel Time Route and Sub-sections

### 4.2.1 AM Peak Period

For the weekday AM peak period, the travel times in northbound and southbound directions along the Henry Lawson Drive for all the modelled scenarios in 2031 and 2041 are presented in Table 4-4 and their corresponding graphs showing the cumulative travel times are shown in Figure 4-3 to Figure 4-6.

Table 4-4: AM Peak Option Modelling Travel Time Results Comparison

| Southbound | 08:53 | 11:28 | 02:35 | 11:06 | 02:13 | 12:18 | 03:25 | 12:30 | 03:37 |
|  |  | Average |  |  |  |  |  |  |  |
| Northbound | 09:08 | 12:44 | 03:36 | 11:33 | 02:25 | 13:31 | 04:22 | 15:42 | 06:34 |
| Southbound | 09:02 | 11:17 | 02:15 | 11:03 | 02:01 | 11:46 | 02:44 | 11:45 | 02:43 |

During the AM peak in 2031, the average northbound travel time along Henry Lawson Drive is likely to increase by two and a half minutes in the Option Scenario and increase by three and a half minutes in the Do-Minimum Scenario when compared to the Base Case year. The southbound travel time along Henry Lawson Drive is expected to increase from around nine minutes in the Base Case to around 11 minutes in both Do-Minimum and Option scenarios.

In 2041 AM peak, the northbound average travel time is expected to increase by over four minutes in the DoMinimum and over six and a half minutes in the Option Scenario when compared to the Base Case Scenario. The southbound travel time is likely to increase almost three minutes on average in the Do-Minimum and seven minutes in the Option scenario.

The reason for higher travel times in Option Scenario during 2041 AM peak period is explained in detail in Section 4.3.

Figure 4-3: Henry Lawson Drive Northbound - 2031 Weekday AM Peak Modelled Travel Time Comparison

[^2]

Figure 4-5: Henry Lawson Drive Northbound - 2041 Weekday AM Peak Modelled Travel Time Comparison

Figure 4-6: Henry Lawson Drive Southbound - 2041 Weekday AM Peak Modelled Travel Time Comparison

### 4.2.2 PM Peak Period

For PM peak, the northbound and southbound travel times along Henry Lawson Drive for all the modelled scenarios in 2031 and 2041 are presented in Table 4-5 and their corresponding graphs showing the cumulative travel times are shown in Figure 4-7 to Figure 4-10.

Table 4-5: PM Peak Option Modelling Travel Time Results Comparison

| Direction | 2022 | 2031 |  |  |  | 2041 |  |  |  |

| Southbound | 11:27 | 28:16 | 16:49 | 30:25 | 18:58 | 30:10 | 18:44 | 33:57 | 22:30 |
|  |  | Average |  |  |  |  |  |  |  |
| Northbound | 08:33 | 17:23 | 08:49 | 11:58 | 03:24 | 19:55 | 11:22 | 14:25 | 05:51 |
| Southbound | 10:55 | 23:22 | 12:27 | 23:43 | 12:48 | 24:45 | 13:50 | 25:49 | 14:54 |

During the PM peak in 2031, the average northbound travel time along the Henry Lawson Drive is expected to increase by almost nine minutes in the Do-Minimum and three and a half minutes in the Option Scenario when compared to the Base Case. The southbound average travel time along Henry Lawson Drive is expected to increase from around 11 minutes in the Base Case year to around 23.5 minutes in both DoMinimum and Option scenarios.

In 2041, the average northbound travel time is expected to increase by over 11 minutes in the Do-Minimum and almost six minutes in the Option Scenario when compared to the Base Case. The southbound average travel time along Henry Lawson Drive is expected to increase from around 11 minutes in the Base Case year to nearly 25 minutes in the Do-Minimum and nearly 26 minutes in the Option scenario.

Figure 4-7: Henry Lawson Drive Northbound - 2031 Weekday PM Peak Modelled Travel Time Comparison

Figure 4-8 Henry Lawson Drive Southbound - 2031 Weekday PM Peak Modelled Travel Time Comparison

Figure 4-9: Henry Lawson Drive Northbound - 2041 Weekday PM Peak Modelled Travel Time Comparison

Figure 4-10 Henry Lawson Drive Southbound - 2041 Weekday PM Peak Modelled Travel Time Comparison

The delay in the southbound direction is observed to happen near the Haig Avenue/ HLD and Rabaul Road/ HLD intersections, where the two lanes merge to one lane slowing traffic at the merge location creating a traffic bottleneck as shown in Figure 4-11 and as a result the congestion propagates downstream causing high delays.

Figure 4-11: Traffic bottleneck upstream (SB direction) of Rabaul Road/ HLD intersection

### 4.2.3 Weekend Peak Period

For the weekend peak period, the travel times in the northbound and southbound directions along Henry Lawson Drive for all the modelled scenarios in 2031 and 2041 are presented in Table 4-6 and their corresponding graphs showing the cumulative travel times are shown in Figure 4-12 to Figure 4-15.

Table 4-6: Weekend Peak Option Modelling Travel Time Results Comparison

| Direction | 2022 | 2031 |  |  |  | 2041 |  |  |  |

| Southbound | 09:11 | 11:02 | 01:51 | 11:14 | 02:04 | 11:17 | 02:07 | 11:10 | 02:00 |
|  |  | 8:45 AM-9:45 AM |  |  |  |  |  |  |  |
| Northbound | 09:56 | 08:40 | 01:16 | 09:04 | 00:53 | 10:35 | 00:38 | 08:49 | 01:07 |
| Southbound | 08:53 | 11:08 | 02:16 | 11:06 | 02:13 | 11:36 | 02:43 | 11:14 | 02:21 |
|  |  | Average |  |  |  |  |  |  |  |
| Northbound | 09:08 | 08:34 | 00:34 | 08:39 | 00:29 | 09:54 | 00:46 | 08:37 | 00:31 |
| Southbound | 09:02 | 11:05 | 02:03 | 11:10 | 02:08 | 11:27 | 02:25 | 11:12 | 02:10 |

During the weekend peak in 2031, the northbound average travel time along Henry Lawson Drive is likely to be improved by around 30 seconds for both Do-Minimum and Option scenarios in comparison to the Base Case year. The southbound average travel time along Henry Lawson Drive is expected to increase from around nine minutes in the Base Case to over 11 minutes in both Do-Minimum and Option scenarios.

During the weekend peak in 2041, the northbound average travel time along Henry Lawson Drive is likely to be improved by about 30 seconds for the Option Scenario in comparison to the Base Case year, whereas the Do Minimum scenario sees in increase of nearly one minute along the same route.

The southbound average travel time is expected to increase from around nine minutes in the Base Case year to approximately over 11 minutes in both Do-Minimum and Option scenarios.

### 4.3 Intersection Level of Service

This section provides a simulated Level of Services (LOS) across the modelled time periods at the nine key intersections in the modelled area. The detailed results are presented in Appendix B.

The key indicator of intersection performance level of service (LOS) is delay, where results are ranked on a scale from A to F as shown in Table 4-7 (Traffic Modelling Guidelines, 2013). As intersections become more congested, the delay increases, reducing the intersection LOS towards F. LOS F starts when the average delay reaches 70 seconds per vehicle and is the final category, regardless of how high delays reach. For traffic signals, the average movement delay and overall LOS for all movements is reported.

Intersections classified as LOS D are considered to operate within acceptable limits. Intersections classified as LOS E and F are not considered to operate within acceptable limits.

Table 4-7: Level of Service criteria in accordance with RMS Traffic Modelling Guidelines

| Level of <br> service | Average delay per <br> vehicle (s) | Traffic Signal, Roundabouts | Give way and stop signs |
| :---: | :---: | :---: | :---: |
| A | $<14$ | Good operation | Good operation |
| B | 15 to 28 | Good with acceptable delays \& spare capacity | Acceptable delays \& spare capacity |
| C | 29 to 42 | Satisfactory | Satisfactory, but accident study <br> required |
| D | 43 to 56 | Operating near capacity | Near capacity \& accident study <br> required |
| E | 57 to 70 | At capacity, at signals, incidents will cause |  |
| excessive delays | At capacity, requires other control <br> mode |  |  |
| F | $>70$ | Unsatisfactory and requires additional capacity | Unsatisfactory and requires <br> additional capacity |

Figure 4-16 illustrates the key map where intersection locations and IDs are shown for readability.

Figure 4-16: Key map with intersection locations and IDs

### 4.3.1 2031 AM Peak Period

Table 4-8 and Table 4-9 present a summary of the performance of the nine key intersections in the study area in 2031 AM peak.

Table 4-8: 2031 AM Peak Intersection Level of Service Summary 7:45-8:45 AM

| 4 | HLD/ Milperra Rd | 6,809 | 355 | F | 7,834 | 321 | F |  |
| 5 | HLD / Keys Pde/Flower power | 2,509 | 33 | C | 2,870 | 36 | C |  |
| 6 | HLD / Bullecourt Ave | 2,467 | 46 | D | 2,810 | 45 | D |  |
| 7 | HLD / Pozieres Ave | 2,376 | 32 | C | 2,460 | 16 | B |  |
| 8 | Milperra Rd / Murray Jones Dr | 3,620 | 159 | F | 4,279 | 68 | E |  |
| 9 | Milperra Rd / Ashford Ave | 3,973 | 80 | F | 4,549 | 43 | D |  |

Summary of 2031 AM modelling results discussed below:

- Below mentioned intersections are performing within acceptable operational limits for all scenarios in all time periods.
- Henry Lawson Drive/ Rabaul Road
- Henry Lawson Drive/ Tower Road
- Henry Lawson Drive/ Keys Parade
- Henry Lawson Drive/ Bullecourt Avenue
- Henry Lawson Drive/ Pozieres Avenue
- These intersections do not operate within acceptable operational limits for all scenarios in all time periods.
- Henry Lawson Drive/ Haig Avenue
- Henry Lawson Drive/ Milperra Road
- These intersections operate within acceptable operational limits only for the Future Option scenario.

## - Milperra Road/ Murray Jones Drive

- Milperra Road/ Ashford Avenue
- The Milperra Road and Newbridge Road intersection performs at LOS F with high delays in all scenarios and time periods. This suggests that the intersection does not have enough capacity to cater for the traffic demand.
- The Haig Avenue intersection performs at LOS F in all scenarios and time periods. Analysis of both scenarios modelling performance indicates that the high delays in the northbound are caused by increased volume of traffic at the intersection because of improved throughput south of intersection by virtue of the Stage 1A upgrade in both Do-Minimum and Option scenarios. The delay in the southbound direction is the result of only one lane running southbound, north of the Beale Street intersection and two lanes merge to one lane, south of the Rabaul Road intersection.
- The intersections at Keys Parade and Bullecourt Avenue have comparable results for both DoMinimum and Future Option scenarios in 2031 AM peak period, albeit Do-Minimum scenario having less capacity on Henry Lawson Drive between these two intersections. The reason is, a good percentage of vehicles who accessed Henry Lawson Drive to reach Bullecourt Avenue in the Future Option scenario, are using Ashford Avenue to reach Bullecourt Avenue in the Do-Minimum scenario. However, this phenomenon is also impacting the performance of Ashford Avenue/ Milperra Road intersection in the Do-Minimum Scenario.

### 4.3.2 2041 AM Peak Period

Table 4-10 and Table 4-11 present a summary of the performance of the nine key intersections in the study area in 2041 AM peak.

Table 4-10: 2041 AM Peak Intersection Level of Service Summary 7:45-8:45 AM

| ID | Intersection | Do minimum |  |  | Option |  |  |
| :---: | :--- | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Volume | Delay (s) | LOS | Volume | Volume | LOS |
| 1 |  | 2,849 | 104 | F | 2,865 | 107 | F |
| 2 | HLD / Rabaul Rd | 2,672 | 22 | B | 2,688 | 27 | B |
| 3 | HLD / Tower Rd | 3,311 | 25 | B | 3,411 | 38 | C |
| 4 | HLD/ Milperra Rd | 7,036 | 242 | F | 7,599 | 215 | F |

| 6 | HLD / Bullecourt Ave | 2,490 | 40 | C | 3,012 | 35 | C |
| 7 | HLD / Pozieres Ave | 2,618 | 35 | C | 2,728 | 24 | B |
| 8 | Milperra Rd / Murray Jones Dr | 4,074 | 29 | C | 3,985 | 5 | A |
| 9 | Milperra Rd / Ashford Ave | 4,568 | 73 | F | 4,528 | 33 | C |

Table 4-11: 2041 AM Peak Intersection Level of Service Summary 8:45-9:45 AM

| ID | Intersection | Do minimum |  |  | Option |  |  |
| :---: | :--- | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Volume | Delay (s) | LOS | Volume | Volume | LOS |
| 1 | HLD / Haig Ave | 2,941 | 97 | F | 3,084 | 106 | F |
| 2 | HLD / Rabaul Rd | 2,944 | 12 | A | 3,093 | 26 | B |
| 3 | HLD / Tower Rd | 3,470 | 33 | C | 3,590 | 66 | E |
| 4 | HLD/ Milperra Rd | 6,958 | 404 | F | 7,458 | 323 | F |
| 5 | HLD / Keys Pde/Flower power | 2,705 | 44 | D | 2,477 | 41 | C |
| 6 | HLD / Bullecourt Ave | 2,672 | 56 | D | 2,528 | 89 | F |
| 7 | HLD / Pozieres Ave | 2,633 | 53 | D | 2,025 | 111 | F |
| 8 | Milperra Rd / Murray Jones Dr | 3,895 | 172 | F | 4,173 | 8 | A |
| 9 | Milperra Rd / Ashford Ave | 4,349 | 117 | F | 4,648 | 35 | C |

Summary of 2041 AM modelling results discussed below:

- Henry Lawson Drive/ Rabaul Road intersection is performing within acceptable operational limits for all scenarios in all time periods.
- Below mentioned intersections do not operate within acceptable operational limits for all scenarios in all time periods.
- Henry Lawson Drive/ Haig Avenue
- Henry Lawson Drive/ Milperra Road
- These intersections operate within acceptable operational limits only for the Future Option scenario.
- Milperra Road/ Murray Jones Drive
- Milperra Road/ Ashford Avenue
- These intersections operate within acceptable operational limits only for the Do-Minimum scenario.
- Henry Lawson Drive/ Tower Road
- Henry Lawson Drive/ Keys Parade
- Henry Lawson Drive/ Bullecourt Avenue
- Henry Lawson Drive/ Pozieres Avenue
- The intersections at Keys Parade and Bullecourt Avenue are performing within acceptable operational limits for the Do-Minimum scenario in 2041 AM peak period, albeit Do-Minimum scenario having less capacity on Henry Lawson Drive between these two intersections. The reason is, a good percentage of vehicles who accessed Henry Lawson Drive to reach Bullecourt Avenue in the Future Option scenario, are using Ashford Avenue to reach Bullecourt Avenue in the Do-Minimum scenario. However, this phenomenon is negatively impacting the performance of Ashford Avenue/ Milperra Road and Milperra Road/ Murray Jones Drive intersections in the Do-Minimum Scenario.
- For instance, in 2041 AM (08:30-08:45 AM), $55 \%$ of total vehicles coming from north of the Milperra Road intersection used Henry Lawson Drive to reach Bullecourt Avenue and $45 \%$ used Ashford Avenue to reach Bullecourt Avenue in the case of Do-Minimum scenario. However, for the Future Option scenario, a staggering $89 \%$ of total vehicles used Henry Lawson Drive to reach Bullecourt Avenue in the same period. This explains the above phenomenon.
- In the Option Scenario, the Bullecourt Avenue intersection operates at LOS C in the first hour and deteriorates to LOS F in the second hour. This is because the right turn traffic movement from the south approach at the Bullecourt Avenue/ HLD intersection queues up because of spill back resulting from a capacity constraint along Bullecourt Avenue between Henry Lawson Drive and Ashford Avenue as illustrated in Figure 4-17. In the Do-Minimum Scenario, Bullecourt Avenue is less constrained because a great proportion of vehicles who accessed Henry Lawson Drive to reach Bullecourt Avenue in Future Option scenario, are using Ashford Avenue to reach Bullecourt Avenue. The Do-Minimum Scenario performs at LOS D or better.

Figure 4-17: Queuing up at Bullecourt Avenue/ HLD intersection (2041 AM Peak Option Scenario)

- The Pozieres Avenue intersection performs at LOS D or better in the Do-Minimum scenario. The performance in the Future Option scenario deteriorates from LOS B in the first hour to LOS F in the second hour due to traffic congestion propagating from the Bullecourt Avenue intersection to the Pozieres Avenue intersection as shown in Figure 4-17.
- The Milperra Road/ Ashford Avenue intersection is expected to operate at LOS D or better in the Options Scenario. The Do-Minimum Scenario would operate at LOS F in 2041 AM peak period with high delay particularly in the second peak hour, impacting the performance of the adjacent Milperra Road/ Murray Jones Drive intersection. This can be attributed to the extra vehicles coming from the North and West of Milperra Road/ Henry Lawson Drive intersection using Ashford Avenue to reach Bullecourt Avenue.

In general, 2041 AM results suggest that the delays will increase impacting the LOS in comparison to 2031 AM.

### 4.3.3 2031 PM Peak Period

Table 4-12 and Table 4-13 present a summary of the performance of the nine key intersections in the study area in 2031 PM peak.

Table 4-12: 2031 PM Peak Intersection Level of Service Summary 3:30-4:30 PM

| ID | Intersection | Do minimum |  |  | Option |  |  |
| :---: | :--- | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Volume | Delay (s) | LOS | Volume | Delay (s) | LOS |
| 1 |  | 2,422 | 184 | F | 2,509 | 163 | F |
| 2 | HLD / Rabaul Rd | 2,398 | 78 | F | 2,517 | 49 | D |
| 3 | HLD / Tower Rd | 2,962 | 22 | B | 3,053 | 19 | B |
| 4 | HLD/ Milperra Rd | 6,882 | 333 | F | 7,325 | 322 | F |
| 5 | HLD / Keys Pde/Flower power | 2,412 | 29 | C | 2,659 | 18 | B |
| 6 | HLD / Bullecourt Ave | 2,354 | 41 | C | 2,730 | 18 | B |
| 7 | HLD / Pozieres Ave | 2,464 | 19 | B | 2,559 | 10 | A |
| 8 | Milperra Rd / Murray Jones Dr | 4,242 | 16 | B | 4,197 | 29 | C |
| 9 | Milperra Rd / Ashford Ave | 4,571 | 114 | F | 4,589 | 148 | F |

Table 4-13: 2031 PM Peak Intersection Level of Service Summary 4:30-5:30 PM

| ID | Intersection | Do minimum |  |  | Option |  |  |
| :---: | :--- | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Volume | Delay (s) | LOS | Volume | Delay (s) | LOS |
| 1 |  | 2,146 | 286 | F | 2,270 | 259 | F |
| 2 | HLD / Rabaul Rd | 2,495 | 96 | F | 2,609 | 85 | F |
| 3 | HLD / Tower Rd | 2,993 | 41 | C | 3,105 | 18 | B |
| 4 | HLD/ Milperra Rd | 7,039 | 475 | F | 7,520 | 445 | F |
| 5 | HLD / Keys Pde/Flower power | 2,699 | 46 | D | 2,722 | 56 | D |
| 6 | HLD / Bullecourt Ave | 2,455 | 78 | F | 2,789 | 20 | B |
| 7 | HLD / Pozieres Ave | 2,275 | 84 | F | 2,360 | 11 | A |
| 8 | Milperra Rd / Murray Jones Dr | 4,056 | 44 | D | 3,929 | 58 | E |
| 9 | Milperra Rd / Ashford Ave | 4,400 | 143 | F | 4,260 | 214 | F |

Summary of 2031 PM modelling results discussed below:

- Below mentioned intersections are performing within acceptable operational limits for all scenarios in all time periods.
- Henry Lawson Drive/ Tower Road
- Henry Lawson Drive/ Keys Parade
- These intersections do not operate within acceptable operational limits for all scenarios in all time periods.
- Henry Lawson Drive/ Haig Avenue
- Henry Lawson Drive/ Milperra Road
- Milperra Road/ Ashford Avenue
- These intersections operate within acceptable operational limits only for the Future Option scenario.
- Henry Lawson Drive/ Bullecourt Avenue
- Henry Lawson Drive/ Pozieres Avenue
- The Milperra Road/ Murray Jones Drive intersection operates within acceptable operational limits only for the Do-Minimum scenario. This intersection only .just eclipses acceptable LOS criteria in the $2^{\text {nd }}$ hour of the PM peak with the future option scenario
- The Milperra Road and Newbridge Road intersection would perform at LOS F with high delays in all scenarios and time periods. This suggests that the intersection does not have enough capacity to cater for the traffic demand.
- The Haig Avenue intersection performs at LOS F in all scenarios and time periods. Analysis of both scenarios modelling performance indicates that the high delays in the northbound are caused by increased volume of traffic at the intersection because of improved throughput south of intersection by virtue of the Stage 1A upgrade in both Do-Minimum and Option scenarios. The delay in the southbound direction is the result of only one lane running southbound, north of the Beale Street intersection and two lanes merge to one lane, south of the Rabaul Road intersection.
- For the Do-Minimum scenario, the Bullecourt Avenue intersection performs at LOS C during first hour and the performance deteriorates to LOS F in the second hour. For the Option scenario, the Bullecourt Avenue intersection operates at LOS B. The deterioration in performance for the DoMinimum is due to the formation of queues on the Keys Parade south approach which propagates traffic shockwaves to downstream resulting in congestion at the Bullecourt Avenue intersection. This effect in the Do-Minimum Scenario is due to less capacity in comparison to the Option scenario.
- The Pozieres Avenue intersection performs at LOS A in the Option Scenario. The performance in the Do-Minimum Scenario is LOS B during the first hour and it deteriorates to LOS F in the second hour.

### 4.3.4 2041 PM Peak Period

Table 4-14 and Table 4-15 present a summary of the performance of the nine key intersections in the study area in 2041 PM peak.

Table 4-14: 2041 PM Peak Intersection Level of Service Summary 3:30-4:30 PM

| ID | Intersection | Do minimum |  |  | Option |  |  |
| :---: | :--- | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Volume | Delay (s) | LOS | Volume | Delay (s) | LOS |
| 1 | HLD / Haig Ave | 2,358 | 182 | F | 2,412 | 159 | F |
| 2 | HLD / Rabaul Rd | 2,338 | 72 | F | 2,398 | 43 | D |
| 3 | HLD / Tower Rd | 2,793 | 28 | B | 2,793 | 17 | B |
| 4 | HLD/ Milperra Rd | 7,355 | 309 | F | 7,569 | 316 | F |
| 5 | HLD / Keys Pde/Flower power | 2,554 | 36 | C | 2,710 | 23 | B |
| 6 | HLD / Bullecourt Ave | 2,444 | 39 | C | 2,792 | 19 | B |
| 7 | HLD / Pozieres Ave | 2,702 | 44 | D | 2,862 | 18 | B |
| 8 | Milperra Rd / Murray Jones Dr | 4,527 | 11 | A | 4,549 | 17 | B |
| 9 | Milperra Rd / Ashford Ave | 4,883 | 82 | F | 4,929 | 65 | E |

Table 4-15: 2041 PM Peak Intersection Level of Service Summary 4:30-5:30 PM

| ID | Intersection | Do minimum |  |  | Option |  |  |
| :---: | :--- | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Volume | Delay (s) | LOS | Volume | Delay (s) | LOS |
| 1 | HLD / Haig Ave | 2,155 | 285 | F | 2,202 | 254 | F |
| 2 | HLD / Rabaul Rd | 2,462 | 95 | F | 2,545 | 77 | F |
| 3 | HLD / Tower Rd | 2,742 | 42 | C | 2,857 | 17 | B |
| 4 | HLD/ Milperra Rd | 7,431 | 454 | F | 7,944 | 442 | F |
| 5 | HLD / Keys Pde/Flower power | 2,720 | 43 | D | 2,883 | 96 | F |
| 6 | HLD / Bullecourt Ave | 2,436 | 61 | E | 2,794 | 34 | C |
| 7 | HLD / Pozieres Ave | 2,366 | 98 | F | 2,638 | 15 | B |
| 8 | Milperra Rd / Murray Jones Dr | 4,378 | 40 | C | 4,345 | 51 | D |
| 9 | Milperra Rd / Ashford Ave | 4,758 | 143 | F | 4,690 | 196 | F |

Summary of 2041 PM modelling results discussed below:

- Below mentioned intersections are performing within acceptable operational limits for all scenarios in all time periods.
- Henry Lawson Drive/ Tower Road
- Milperra Road/ Murray Jones Drive
- These intersections do not operate within acceptable operational limits for all scenarios in all time periods.
- Henry Lawson Drive/ Haig Avenue
- Henry Lawson Drive/ Milperra Road
- Milperra Road/ Ashford Avenue
- These intersections operate within acceptable operational limits only for the Future Option scenario.
- Henry Lawson Drive/ Bullecourt Avenue
- Henry Lawson Drive/ Pozieres Avenue
- The Henry Lawson Drive/ Keys Parade intersection operates within acceptable operational limits only for the Do-Minimum scenario.
- The Keys Parade intersection performs at LOS D (in the second hour) on the 'without proposal' scenario compared to LOS F in the 'with project' scenario. This can be attributed to the northbound capacity issues present on the upstream Bullecourt Avenue and Pozieres Avenue intersections with Henry Lawson Drive in the 'without project' scenario, as evidenced by the lower intersection throughput volumes and longer northbound travel times compared to the 'with project' scenario seen in Table 4-5.

For both 2031 and 2041 scenarios, the results suggest a better performance for the Option Scenario in comparison to the Do-Minimum Scenario in the PM peak period.

### 4.3.5 2031 Weekend Peak Period

Table 4-16 and Table 4-17 present a summary of the performance of the nine key intersections in the study area in 2031 weekend peak.

Table 4-16: 2031 Weekend Peak Intersection Level of Service Summary 11:30 AM - 12:30 PM

| ID | Intersection | Do minimum |  |  | Option |  |  |
| :---: | :--- | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Volume | Delay (s) | LOS | Volume | Delay (s) | LOS |
| 1 |  | 2,969 | 88 | F | 2,958 | 92 | F |
| 2 | HLD / Rabaul Rd | 2,806 | 8 | A | 2,790 | 8 | A |
| 3 | HLD / Tower Rd | 3,356 | 19 | B | 3,309 | 22 | B |
| 4 | HLD/ Milperra Rd | 7,144 | 70 | E | 7,302 | 65 | E |
| 5 | HLD / Keys Pde/Flower power | 2,762 | 19 | B | 2,582 | 31 | C |
| 6 | HLD / Bullecourt Ave | 2,175 | 25 | B | 2,394 | 21 | B |
| 7 | HLD / Pozieres Ave | 2,493 | 13 | A | 2,442 | 12 | A |
| 8 | Milperra Rd / Murray Jones Dr | 4,313 | 4 | A | 4,252 | 6 | A |
| 9 | Milperra Rd / Ashford Ave | 4,702 | 61 | E | 4,706 | 29 | C |

Table 4-17: 2031 Weekend Peak Intersection Level of Service Summary 12:30-01:30 PM

| ID | Intersection | Do minimum |  |  | Option |  |  |
| :---: | :--- | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Volume | Delay (s) | LOS | Volume | Delay (s) | LOS |
| 1 |  | 3,272 | 87 | F | 3,275 | 93 | F |
| 2 | HLD / Rabaul Rd | 3,189 | 8 | A | 3,194 | 12 | A |
| 3 | HLD / Tower Rd | 3,625 | 21 | B | 3,652 | 26 | B |
| 4 | HLD/ Milperra Rd | 7,506 | 105 | F | 7,429 | 70 | E |
| 5 | HLD / Keys Pde/Flower power | 2,746 | 18 | B | 2,594 | 33 | C |
| 6 | HLD / Bullecourt Ave | 2,173 | 25 | B | 2,326 | 23 | B |
| 7 | HLD / Pozieres Ave | 2,427 | 12 | A | 2,441 | 11 | A |
| 8 | Milperra Rd / Murray Jones Dr | 4,429 | 18 | B | 4,056 | 11 | A |
| 9 | Milperra Rd / Ashford Ave | 4,801 | 83 | F | 4,475 | 43 | D |

Summary of 2031 weekend modelling results discussed below:

- Below mentioned intersections are performing within acceptable operational limits for all scenarios in all time periods.
- Henry Lawson Drive/ Rabaul Road
- Henry Lawson Drive/ Tower Road
- Henry Lawson Drive/ Keys Parade
- Henry Lawson Drive/ Bullecourt Avenue
- Henry Lawson Drive/ Pozieres Avenue
- Milperra Road/ Murray Jones Drive
- These intersections do not operate within acceptable operational limits for all scenarios in all time periods.
- Henry Lawson Drive/ Haig Avenue
- Henry Lawson Drive/ Milperra Road
- The Milperra Road/ Ashford Avenue intersection operates within acceptable operational limits only for the Future Option scenario.
- The Milperra Road and Newbridge Road intersection would perform at LOS E in the first hour and the performance deteriorates to LOS F in the second hour for Do-Minimum and LOS E in the Future Option scenario. This suggests that the intersection does not have enough capacity to cater for the traffic demand. In general, the delay is considerably low in comparison to AM and PM peak periods.
- The Haig Avenue intersection performs at LOS F in all scenarios and time periods. Analysis of both scenarios modelling performance indicates that the delays in the northbound are caused by increased volume of traffic at the intersection because of improved throughput south of intersection by virtue of the Stage 1A upgrade in both Do-Minimum and Option scenarios. The delay in the southbound direction is the result of only one lane running southbound, north of the Beale Street intersection and two lanes merge to one lane, south of the Rabaul Road intersection.
- The Milperra Road/ Ashford Avenue intersection would perform at LOS D or better in the Option Scenario. However, the intersection is expected to operate at LOS F in the Do-Minimum Scenario.

### 4.3.6 2041 Weekend Peak Period

Table 4-18 and Table 4-19 present a summary of the performance of the nine key intersections in the study area in 2041 weekend peak.

Table 4-18: 2041 Weekend Peak Intersection Level of Service Summary 11:30 AM - 12:30 PM

| ID | Intersection | Do minimum |  |  | Option |  |  |
| :---: | :--- | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Volume | Delay (s) | LOS | Volume | Delay (s) | LOS |
| 1 | HLD / Haig Ave | 2,977 | 103 | F | 3,032 | 91 | F |
| 2 | HLD / Rabaul Rd | 2,772 | 15 | B | 2,854 | 8 | A |
| 3 | HLD / Tower Rd | 3,358 | 20 | B | 3,381 | 22 | B |
| 4 | HLD/ Milperra Rd | 7,345 | 71 | F | 7,644 | 76 | F |
| 5 | HLD / Keys Pde/Flower power | 2,851 | 18 | B | 2,952 | 29 | C |
| 6 | HLD / Bullecourt Ave | 2,205 | 24 | B | 2,620 | 23 | B |
| 7 | HLD / Pozieres Ave | 2,547 | 14 | A | 2,563 | 13 | A |
| 8 | Milperra Rd / Murray Jones Dr | 4,418 | 5 | A | 4,472 | 12 | A |
| 9 | Milperra Rd / Ashford Ave | 4,812 | 52 | D | 4,832 | 32 | C |

Table 4-19: 2041 Weekend Peak Intersection Level of Service Summary 12:30-01:30 PM

| ID | Intersection | Do minimum |  |  | Option |  |  |
| :---: | :--- | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Volume | Delay (s) | LOS | Volume | Delay (s) | LOS |
| 1 |  | 3,349 | 104 | F | 3,344 | 87 | F |
| 2 | HLD / Rabaul Rd | 3,217 | 19 | B | 3,257 | 11 | A |
| 3 | HLD / Tower Rd | 3,692 | 35 | C | 3,736 | 29 | C |
| 4 | HLD/ Milperra Rd | 7,563 | 92 | F | 7,757 | 97 | F |
| 5 | HLD / Keys Pde/Flower power | 2,768 | 19 | B | 2,992 | 28 | B |
| 6 | HLD / Bullecourt Ave | 2,199 | 27 | B | 2,662 | 27 | B |
| 7 | HLD / Pozieres Ave | 2,437 | 13 | A | 2,488 | 11 | A |
| 8 | Milperra Rd / Murray Jones Dr | 4,418 | 11 | A | 4,389 | 21 | B |
| 9 | Milperra Rd / Ashford Ave | 4,826 | 86 | F | 4,696 | 29 | C |

In 2041 weekend, for the Do-Minimum and Option Scenario, the overall LOS would not differ much from the 2031 modelled values.

For both 2031 and 2041 scenarios, the results suggest that the weekend modelling produces comparable performance for the Do-Minimum Scenario and Option Scenario.

## 5 Summary and Conclusions

This report has been prepared to document the development of future scenarios and assess their performance.

The following lists some of the key items of the study:

- Two scenarios along the Henry Lawson Drive were considered, the Do-Minimum Scenario and Option Scenario.
- Both the scenarios were modelled for the opening year (2031) and ten years after (2041).
- The traffic demands used for the future year models were developed from the 2021, 2031 and 2041 STFM sub-area matrices and link volume plots provided by TfNSW as part of the project.

The modelling results have been assessed in the form of overall network statistics, corridor travel time and key intersection delay, including the Level of Service (LOS):

## Network Performance Statistics

- Across the future year scenarios, the results suggest a slightly better performance for the Option Scenario compared to the Do-Minimum Scenario in AM, PM and weekend peaks for both 2031 and 2041.
- There is a significant increase in the number of unreleased vehicles and incomplete trips compared to the Base Case Scenario, which increases incrementally from years 2031 to 2041, suggesting an insufficiency in network capacity to cater for the growing traffic demand.

## Level of Service (LOS)

- The intersections at Keys Parade and Bullecourt Avenue have comparable results for both DoMinimum and Future Option scenarios in 2031 AM peak period, albeit Do-Minimum scenario having less capacity on Henry Lawson Drive between these two intersections. This is because a good percentage of vehicles who access Henry Lawson Drive to reach Bullecourt Avenue in the Future Option scenario, are using Ashford Avenue via Milperra Road to reach Bullecourt Avenue in the DoMinimum scenario. However, this phenomenon is impacting the performance of Ashford Avenue/ Milperra Road intersection in the Do-Minimum scenario. This effect is more pronounced in 2041 AM peak period.
- For both 2031 and 2041 scenarios, the results suggest a better performance for the Option Scenario in comparison to the Do-Minimum Scenario in the PM peak period. The weekend modelling produces comparable performance for the Do-Minimum Scenario and Option Scenario, except for the Milperra Road/ Ashford Avenue intersection, where the delay is high for the Do-Minimum.
- For 2041 AM peak period, in the Option Scenario, the Bullecourt Avenue intersection operates at LOS C in the first hour and deteriorates to LOS F in the second hour. This is because the right turn traffic movement from the south approach at the Bullecourt Avenue/ HLD intersection queues up because of spill back resulting from a capacity constraint along Bullecourt Avenue between Henry Lawson Drive and Ashford Avenue. This traffic congestion propagates further downstream impacting the performance of Pozieres Avenue intersection. However, in the Do-Minimum Scenario, Bullecourt Avenue is less constrained because a great proportion of vehicles who accessed Henry Lawson Drive to reach Bullecourt Avenue in Future Option scenario, are using Ashford Avenue to reach Bullecourt Avenue. The Do-Minimum Scenario performs at LOS D or better.
- In general, 2041 AM and PM results suggest that the delays will increase impacting the LOS in comparison to the 2031 AM and PM due to increased demand in 2041. However, in 2041 weekend for the Do-Minimum and Option Scenario, the overall LOS would not differ much from the 2031 modelled values.
- The Milperra Road and Newbridge Road intersection would perform at unacceptable LOS E or LOS $F$ in all scenarios and time periods. The modelled delays are high, suggesting that the intersection does not have enough capacity to cater for the traffic demand in the tested scenarios.
- The Haig Avenue intersection performs at LOS F in all scenarios and time periods. Analysis of both scenarios modelling performance indicates that the high delays in the northbound are caused by increased volume of traffic at the intersection because of improved throughput south of intersection by virtue of the Stage 1A upgrade in both Do-Minimum and Option scenarios. The delay in the southbound direction is the result of only one lane running southbound, north of the Beale Street intersection and two lanes merge to one lane, south of the Rabaul Road intersection.
- It should be noted that the Henry Lawson Drive traffic performance will likely see its best benefits once all upgrade stages are completed. With only the Stage 1A and Stage 1B upgrades, the merging from two to one lane located north of the Tower Road acts as a bottleneck, impacting the performance of upstream vehicles travelling along the corridor.

## Henry Lawson Drive Travel Time

- The 2031 AM peak period shows an average reduction in travel time in the northbound and southbound directions compared to the Do Minimum scenario. In 2041, there would be an increase in travel times in the northbound direction in the future upgrade scenario compared to the Do Minimum scenario, with negligible difference in travel time in the southbound direction. This would be due to queue spill back at the Bullecourt Avenue / Henry Lawson Drive intersection.
- During PM peak periods, Henry Lawson Drive northbound travel time is expected to decrease by over five minutes in 2031 and five and a half minutes in 2041 in the Future Upgrade scenario compared to the Do Minimum scenario. This is due to there being higher demand for northbound traffic in 2041. The average southbound travel time along Henry Lawson Drive is expected to increase by 20 seconds in the Future Upgrade scenario compared to the Do Minimum scenario in 2031 and by a minute in 2041. The segment of Henry Lawson Drive specifically between Flinders Road and Haig Avenue if predicted to be the most impacted by the Future Option delays.
- During the weekend peak in 2031, the average northbound and southbound travel times along Henry Lawson Drive are likely to be similar in both the Do Minimum and Future Upgrade scenarios. The average southbound travel time along Henry Lawson Drive is expected to be marginally different between the Future Upgrade scenario and the Do Minimum scenario in 2041, with northbound travel times improving by almost one and a half minutes. This is due to the network being able to accommodate weekend demand in both 2031 and 2041.
- In the northbound and southbound directions, high delays are observed at the Milperra Road intersection for all tested scenarios and time periods in both 2031 and 2041.
- The travel time results suggest a better performance for the Future Upgrade scenario compared to the Do Minimum scenario in all time periods modelled, 2041 AM peak period being an exception.

## 1 Introduction

### 1.1 Background

Aurecon was commissioned by Transport for NSW (TfNSW) to deliver the Concept Design Services for Henry Lawson Drive (HLD) upgrade Stage 1B. For traffic and transportation study, a microsimulation corridor model of Henry Lawson Drive in the study area is required. This model is intended to be used for testing few potential upgrade options. The options modelling will enable TfNSW to test different combinations of upgrades to determine the best possible option to implement on the network to improve network performance.

As part of the model development process, Aurecon undertook a model calibration and validation exercise to ensure that the model developed is fit-for-purpose and can be used for option evaluation. The methodology and parameters adopted for the base model are aligned to the TfNSW Traffic Modelling Guidelines (Modelling Guidelines).

This report outlines the steps undertaken in the development of the Base model, data analysis, network coding and results of model calibration and validation. This document does not include discussion of the various option packages that will be tested from the base model. A separate option modelling report will subsequently be provided to outline the various options, corresponding results, and analysis.

### 1.2 Project Background

Transport for NSW is investigating the upgrade of 7.5-kilometre stretch of Henry Lawson Drive between M5 Motorway, Milperra, Lansdowne and Hume Highway. The route corridor of Henry Lawson Drive serves as a major north-south link for movement of freight and general traffic. The land use in the vicinity of the corridor includes a mix of residential, industrial and retail land use as well as airport facilities. The upgrade would help in ensuring that the road corridor can meet growing traffic demand, with residential, commercial, and industrial development expected to increase in the coming years.

The upgrade would be carried out in four stages (Stages 1A, 1B, 2 and 3).
The Stage 1A upgrade of Henry Lawson Drive would provide more capacity for vehicles travelling through the intersection of Henry Lawson Drive, Milperra Road and Newbridge Road. It would improve efficiency along the corridor and safety for motorists and pedestrians.

This project, Stage 1B involves upgrade of Henry Lawson Drive along a 1.8-kilometre section between Keys Parade and the approach to the M5 Motorway. The upgrade of key intersections and widening of Henry Lawson Drive would improve traffic capacity, decrease travel time, and enhance and driver safety.

### 1.2.1 Objectives

The main objectives in developing the microsimulation model are as follows:

- Develop a base case microsimulation model in accordance with the TfNSW Traffic Modelling Guidelines Version $1.0^{1}$ to ensure that it is fit-for-purpose to test future year option scenarios.
- Develop future year flows based on STFM outputs.
- Assess the proposed options along Henry Lawson Drive
- Identify short comings of each option and provide potential remediations to minimise congestion in the study area.
The project study area covers Henry Lawson Drive between Hume Highway and M5 Motorway as shown in Figure 1-1 below.

[^3]

Figure 1-1: Henry Lawson Drive Stage 1B model study area

## 2 Model Form

The development of the model has been undertaken using the Aimsun software suite. Aimsun is an integrated modelling tool which is often used for large scale and complex networks. Aimsun allows different model tiers to be developed in a single model file, resulting in improved route choice network assignment. The geometry configuration function in Aimsun also allows users to code and manage different model options in a single model file.

As part of concept design for Henry Lawson Drive Stage 1A, a microsimulation traffic model was developed using Aimsun Next Version 20.0.3. For Stage 1B, the existing Aimsun model was extended to include the section of Henry Lawson Drive between Keys Parade and South-Western Motorway (M-5). Further, it is suggested that the same version be used for future option testing.

### 2.1 Methodology

The key steps in the modelling process include the following:

- Network development and refinement that involved extension of existing model for Henry Lawson Drive Stage 1A to include Stage 1B study area network.
- Traffic demand estimation
- Model calibration and validation.

Data inputs used for the base model and their sources are discussed at length in Chapter 3. Figure 2-1 illustrates the general modelling methodology adopted in building the base model.

Calibrated Micro Model

Figure 2-1: Methodology Overview

### 2.2 Model Network

The modelled base network includes the following mainline extents:

- Henry Lawson Drive southbound between south of Hume Highway and south of M5 motorway off-ramp.
- Henry Lawson Drive northbound between south of M5 Motorway on-ramp and south of Hume Highway.

Figure 2-2 shows the Aimsun base model network, which aligns with the study area in Figure 1-1.

Figure 2-2: Modelled network HLD1B (Aimsun network snapshot with Zone centroid ID's)

### 2.2.1 Extension of HLD-1A model to include HLD-1B

The key steps in the extension of HLD-1A model (initial model) to include HLD-1B project area are the following:

- Import Open Street Map background to initial model.
- Extend the model to include HLD-1B project area network as shown in Figure 2-3.
- All intersections were coded as per the existing type of intersection control such as priority or signalised. The type of intersection control at each intersection in the project area is shown in Table 2-1.
- Public transport and school bus services were also observed in the study area. The road network infrastructure for bus services beyond Henry Lawson Drive corridor is included in the model and is reserved for use by public transport only. This is to account for the impact of bus services within the study area.

Figure 2-3: Overview of model with open street map background.

| 26 | Henry Lawson Drive \& Hazel Street | Priority |
| 27 | Henry Lawson Drive \& Hynes Street | Priority |

### 2.3 Model Date and Time Periods

For AM and PM modelling, the traffic surveys were undertaken at various locations in the study area on $23^{\text {rd }}$ March 2022 (Wednesday) and from $28^{\text {th }}$ February 2018 to $5^{\text {th }}$ March 2018. The traffic survey data is collected with a 15-minute interval and their collection locations are presented in Table 3-2.
In the case weekend model, TfNSW provided SCATS detector count data for $26^{\text {th }}$ March 2022 (Saturday), $27^{\text {th }}$ March 2022 (Sunday), $02^{\text {nd }}$ April 2022 (Saturday) and $03^{\text {rd }}$ April 2022 (Sunday), and also traffic survey data for 20 ${ }^{\text {th }}$ February 2021 (Saturday).

### 2.3.1 Weekday Peak

An analysis was undertaken to identify the most suitable Weekday AM and PM peak period. The key steps in identifying the peak hour include following:

- Total hourly traffic counts for all surveyed intersections based on 2022 and 2018 traffic survey data was calculated with hours staggered at 15 minutes for AM period (06:00 AM to 10:00 AM) and PM period (03:00 PM to 07:00PM). The staggered hour in both AM and PM period with maximum traffic was identified as peak hour as presented in Figure 2-4.

Figure 2-4: Total hourly traffic count during AM and PM peak period staggered at 15-minute interval

- AM peak hour was clearly identified as 07:45 AM to 08:45 AM.
- For PM period, peak traffic was observed for 03:15 PM to 05:45 PM, requiring further analysis to identify clear peak PM period.
- Google's typical traffic volume viewer was used to study typical traffic condition prevailing on Henry Lawson Drive from 02:45 PM to 06:15 PM at 15-minute interval on a representative weekday (Wednesday). The google images for typical traffic on Henry Lawson Drive corridor were collated and compared. This is presented in Appendix A. The study of typical traffic suggests that congestion on Henry Lawson Drive peaks between 03:30 PM to 04:30 PM. Considering the peak traffic volume and typical Google traffic, peak hour during PM is identified as 03:30 PM to 04:30 PM.

Based on analysis, the peak traffic time periods were determined as follows:

- Weekday Morning (AM) period: 06:45-09:45 AM
- Warm up: 06:45-07:45 AM
- Peak Hour 1: 07:45-08:45 AM
- Peak Hour 2: 08:45-09:45 AM
- Weekday Afternoon (PM) period: 02:30-05:30 PM
- Warm up: 02:30-03:30 PM
- Peak Hour 1: 03:30-04:30 PM
- Peak Hour 2: 04:30-05:30 PM

### 2.3.2 Weekend Peak

An analysis was undertaken to identify the most suitable Weekend peak period. The key steps in identifying the peak hour include following:

- The average of hourly traffic counts of five surveyed midblock counts in 2022 for two weekends was calculated. The staggered hour with maximum traffic was identified as peak hour as presented in Figure 2-5.

Figure 2-5: Average hourly traffic count during weekend period

- Weekend peak hour was identified as 11:30 AM to 12:30 PM on Saturdays.

Based on analysis, the peak traffic time periods were determined as follows:

- Weekend peak period: 10:30 AM - 01:30 PM
- Warm up: 010:30 AM - 11:30 AM
- Peak Hour 1: 11:30 AM - 12:30 PM
- Peak Hour 2: 12:30-01:30 PM

### 2.4 Assumptions and Limitations

The model has been specifically developed to achieve the objectives of this project. Following enlists some of the modelling assumptions and limitations:

- Calibration has been undertaken for 2022 traffic conditions.
- For AM and PM model, the traffic count data has been sourced from Matrix surveys undertaken during 2022 for Stage 1B and 2018 for Stage 1A portion. The traffic counts used for model calibration are therefore a mix of both 2022 and 2018 traffic data. It has however been verified that the collected dates are representative of typical day traffic conditions. The flow differences have also been checked and balanced through the network.
- For weekend model, the traffic count data has been sourced from TfNSW's SCATS detector data collected in 2022 and traffic survey data collected by Matrix in 2021. The heavy vehicle percentages (HV\%) for weekend peak period calculated from 2022 midblock count survey was comparable to the AM peak period. Therefore, HV\% from AM peak period was assumed in this model.
- The Travel Time data has been sourced from HERE data and was collected in 2018 with 15-minute intervals.
- It has been assumed that the available traffic data are true representation of existing conditions.
- Any upstream or downstream congestion outside the model study area has not been considered.

Table 3-1 presents a summary of various data types used for the study, their sources, and application in the model.

Table 3-1: Road Network Datasets

| Data type | Source | Application |
| :--- | :--- | :--- |
| Base model | TfNSW/ Aurecon - Base model for HLD <br> Stage 1A | Base model from Stage 1A extended to <br> include Stage 1B study area. |
| Aerial imagery | Open Street Maps, 2019 Nearmap Imagery | Model network coding, geometry verification |
| Road Classification, <br> Speed Limit Data | Desktop review | Model network coding |
| Traffic Survey Counts | TfNSW provided survey data (Matrix) for 19 <br> intersections and five midblock locations | Traffic survey counts is used for the purpose <br> of model calibration. |
| SCATS traffic count <br> and Signal Data | TfNSW - Count data for eight intersections <br> and signal data (phase splits / times and <br> cycle times (IDM)) | Signal coding and model development |
| Travel Time Survey <br> Data | HERE data provided by TfNSW. | Used for the purpose of model validation |
| Public transport <br> operations | Bus stops, route information data and <br> timetable data were obtained from TfNSW | Coding of bus routes in the base model |
| Zoning and Traffic <br> demands | TfNSW Model | Zoning and prior traffic demands from <br> provided model have been retained. |

### 3.1 Traffic Count Data

Intersection survey counts along with midblock counts and SCATS data formed the inputs to model calibration.

A summary of the traffic survey data available for weekdays along with the collection date is presented in Table 3-2.

Table 3-2: Traffic survey count data summary for weekday

| $\#$ | Intersection | Type | Collection Date | Vehicle Types |
| :--- | :--- | :--- | :--- | :--- |
| 1 | Henry Lawson Drive/ Flinders Road | Priority | $28-02-2018$ | Light and Heavy Vehicles |
| 2 | Henry Lawson Drive/ Keys Parade | Signalised | $23-03-2022$ | Light and Heavy Vehicles |
| 3 | Henry Lawson Drive/ Newbridge Road/ <br> Milperra Road | Signalised | $10-04-2018$ | Light and Heavy Vehicles |
| 4 | Henry Lawson Drive/ Tower Road | Signalised | $23-02-2021$ | Light and Heavy Vehicles |

| 7 | Henry Lawson Drive/ Auld Avenue | Priority | $23-02-2021$ | Light and Heavy Vehicles |

| $\#$ | Intersection | Type | Collection Date | Vehicle Types |
| :--- | :--- | :--- | :--- | :--- |
| 8 | Milperra Road/ Murray Jones Drive | Signalised | $10-04-2018$ | Light and Heavy Vehicles |
| 9 | Milperra Road/ Ashford Avenue | Signalised | $23-03-2022$ | Light and Heavy Vehicles |
| 10 | Henry Lawson Drive/ Raleigh Road | Priority | $23-03-2022$ | Light and Heavy Vehicles |
| 11 | Henry Lawson Drive/ Ruthven Avenue | Priority | $23-03-2022$ | Light and Heavy Vehicles |
| 12 | Henry Lawson Drive/ Whittle Avenue | Priority | $23-03-2022$ | Light and Heavy Vehicles |
| 13 | Henry Lawson Drive/ Amiens Avenue | Priority | $23-03-2022$ | Light and Heavy Vehicles |
| 14 | Henry Lawson Drive/ Bullecourt <br> Avenue | Signalised | $23-03-2022$ | Light and Heavy Vehicles |
| 15 | Henry Lawson Drive/ Ganmain <br> Crescent/ Fromelles Avenue | Priority | $23-03-2022$ | Light and Heavy Vehicles |
| 16 | Henry Lawson Drive/ Hermies Avenue | Priority | $23-03-2022$ | Light and Heavy Vehicles |
| 17 | Henry Lawson Drive/ Pozieres Avenue | Signalised | $23-03-2022$ | Light and Heavy Vehicles |
| 18 | Henry Lawson Drive/ South Western <br> Motorway - M5 | Signalised | $28-02-2018$ | Light and Heavy Vehicles |
|  |  |  |  |  |

The traffic count data for light and heavy vehicles in AM peak period (7:45 AM to 9:45 AM) and PM peak period (3:30 PM to 5:30 PM) was used for calibration of the Base Model.

A summary of the SCATS detector count data and traffic survey data available for weekends along with the collection date is presented in Table 3-3.

Table 3-3: Available intersection count data for weekend

| $\#$ | Intersection | Type | Collection Date |
| :--- | :--- | :--- | :--- |
| 1 | Henry Lawson Drive/ Keys Parade | Signalised | $26-03-2022$ |
| 2 | Henry Lawson Drive/ Auld Avenue | Priority | $23-02-2021$ |
| 3 | Henry Lawson Drive/ Newbridge Road/ <br> Milperra Road | Signalised | $20-02-2021$ |
| 4 | Henry Lawson Drive/ Tower Road | Signalised | $20-02-2021$ |
| 5 | Henry Lawson Drive/ Bullecourt <br> Avenue | Signalised | $26-03-2022$ |
| 6 | Henry Lawson Drive/ Pozieres Avenue | Signalised | $26-03-2022$ |

The traffic count data in the weekend peak period from11:30 AM to 12:30 PM was used for calibration of the Base Model.

### 3.2 Traffic Signals

The signalised intersections in the study area are listed as follows and are visually presented in red colour on Figure $1-1$ showing the study area and key model intersections:

- Henry Lawson Drive/ Pozieres Avenue
- Henry Lawson Drive/ Bullecourt Avenue
- Henry Lawson Drive/ Keys Parade
- Henry Lawson Drive/ Newbridge Road / Milperra Road
- Henry Lawson Drive/ Tower Road
- Henry Lawson Drive/ Haig Avenue
- Milperra Road/ Murray Jones Drive
- Milperra Road/ Ashford Avenue

All signalised intersections above operate using SCATS and SCATS traffic signal data within the project area was sourced from TfNSW. The SCATS diagrams and phasing information was used to code intersections within the model.

The Aimsun model was developed with a 60-minute fixed time signal plans and phasing (e.g., 7.45 AM - 8.45 AM). The signal timing and phasing data was based on the SCATS IDM data provided by TfNSW. Note that as part of the calibration process, slight adjustments were made to some of the signal phases to replicate existing traffic conditions. These adjustments have been duly noted.

### 3.3 Travel Time Survey Data

The travel time data for one week from 27/02/2018 to 05/03/2018, was collected from HERE database ${ }^{2}$ along Henry Lawson Drive from Flinders Road to South-Western Motorway - M5 in both directions. The data used for travel time validation was extracted for the following time periods:

- Weekday AM Peak: 07:45 AM to 09:45 AM
- Weekday PM Peak: 03:30 PM to 05:30 PM
- Weekend Peak: 11:30 AM to 01:30 PM

[^4]

Figure 3-1: Travel Time Route and Sub-sections
The travel time data has been collected for four sub-route sections as shown in Figure 3-1 and listed as follows:

1. Henry Lawson Drive between Flinders Road and Haig Avenue
2. Henry Lawson Drive between Haig Avenue and Milperra Road
3. Henry Lawson Drive between Milperra Road and Bullecourt Avenue
4. Henry Lawson Drive between Bullecourt Avenue and M5

## Traffic Demand

### 4.1 Demand Estimation

Figure 4-1 describes the traffic demand estimation methodology. The matrix from the originally calibrated model has been used as the initial/prior matrix for demand estimation. Where the internal road network was removed, the zones were added together to retain the original trip distribution patterns. The internal trips between the zones that have been detached from the network have also been removed.

The demand profiling has been based on the originally profiled demand from the previous modelling exercise. This captured both the 15 -minute profiling and the heavy vehicle classification.

The profiled demand was manually adjusted where necessary to meet calibration and validation targets and ensure consistency between the observed and modelled traffic volumes.

## Traffic Counts

Figure 4-1: Traffic demand estimation methodology

### 4.2 Trip Balancing

The traffic survey data was analysed and used to develop traffic volume diagrams for every one-hour of the AM, PM and weekend peak periods. As the traffic data available are from different collection dates, discrepancies were identified between the in/out traffic flows at some locations. Therefore, the counts were carefully balanced to reflect a typical day in a week.

### 4.3 Zone Structure

There were 34 zones in the original Vissim base model of Henry Lawson Drive Stage 1B received from TfNSW. It is noted that few zones from Vissim model were aggregated and new zones were also added in the latest Aimsun model. The modified network resulted in 33 zones and the zone system for the model is aligned with the STFM model zones.
For Aimsun modelling of Stage 1B, the existing Aimsun model from Stage 1A was extended to include the section of Henry Lawson Drive between Keys Parade and South-Western Motorway (M-5). As a result, zone numbers used in Stage 1A was retained and additional centroids were given new zone numbers.

### 4.4 Heavy Vehicle Proportion

The proportion of heavy vehicles within the network were estimated from the observed data as the trip balancing process outlined in Section 4.2.

## HV Breakdown:

- 07:45-08:45 AM: 11.33\%
- 08:45-09:45 AM: 15.01\%
- 15:30-16:30 PM: 9.23\%
- 16:30-17:30 PM: 7.45\%
- 11:30 AM - 12:30 PM: $11.33 \%$
- 12:30 PM - 01:30 PM: 15.01\%

### 4.5 Demand Profiles

One-hour demands generated through departure adjustment procedure was then further manually profiled into 15-minute intervals. This was achieved by application of a factor to the one-hour matrices to generate a smooth profile. This led to the preparation of 15-minute demand matrices for AM, PM and weekend peak periods.

The heavy vehicle demand matrices were developed by applying a global factor as discussed in Section 4.4.
The modelled traffic demand profiles are as shown in Figure 4-2, Figure 4-3 and Figure 4-4 for AM, PM and weekend peak periods respectively.

Figure 4-2: Modelled AM Peak Traffic Demand Profiles from 07:45 to 09:45

Figure 4-3: Modelled PM Peak Traffic Demand Profiles from 15:30 to 17:30

Figure 4-4: Modelled Weekend Peak Traffic Demand Profiles from 11:30 to 13:30

## 5 Traffic Assignment

### 5.1 Path Assignment

Within Aimsun, the initial static assignment route choice was calculated using cost equations by taking into consideration section capacity and section travel times. The path assignment from the microsimulation experiment was then based on the set of initial paths generated as part of the static experiment. Figure 5-1 below summarises this path assignment process.

Figure 5-1: Path assignment process

### 5.2 Static OD Adjustment

The Frank-Wolfe assignment algorithm has been used to run the Static OD adjustment scenario. The matrix and trip length distribution elasticities values of 1 each were used for the assignment. The OD adjustment process adjusts the matrices to match the observed data input into the model as a Real Data Set (RDS) file. This resulted in adjusted hourly OD matrices for each of the vehicle classes.

### 5.3 Static Assignment

The static macroscopic experiment adopted the Frank-Wolfe assignment model for static equilibrium assignment, with the stopping criteria set at a relative gap (RGap) value of $0.1 \%$ and/ or a maximum of 100 iterations.

### 5.4 Dynamic Route Choice Parameters

The route choice parameters were adopted from Stage 1A model and were refined as part of the model calibration process. Few traffic management strategies were also used during calibration to reflect the traffic flow patterns. The key with route choice values is to achieve a robust model that can also adjust to changes in the network or demands. The route choice model settings are summarised in Table 5-1.

Table 5-1: Route choice model settings

| Parameter | Value |
| :--- | :---: |
| Behaviour: Two Lane Car Following Model | Enabled |
| Number of vehicles | 4 |
| Max. speed difference | $50 \mathrm{~km} / \mathrm{hr}$ |
| Max. distance | 100 m |
| Max. speed difference on ramp | $70 \mathrm{~km} / \mathrm{hr}$ |
| Speed difference setting | Relative |
| Queue entry speed | $1 \mathrm{~m} / \mathrm{s}$ |
| Queue exit speed | $4 \mathrm{~m} / \mathrm{s}$ |
| Micro Reaction Times |  |
| Simulation Step | 0.8 s |
| Reaction time at Stop | 1.20 s |
| Reaction time at Traffic Light | 1.6 s |
| Arrivals | Exponential |
| Global Arrivals |  |
| Dynamic Traffic Assignment |  |

| Parameter | Value |
| :--- | :---: |
| Cycle | $0: 15: 00$ |
| Number of Intervals | 3 |
| Attractiveness Weighting | 3 |
| User Defined Cost Weight | 1 |
| Use of O/D Routes and Path Assignment Results | $100 \%$ |
| Vehicles following O/D Routes | $100 \%$ |
| Vehicles following Path Assignment Results | Proportional |
| Route Choice Model | Disabled |
| Route Choice Model | 1 |
| Enroute | 3 |
| Initial K-SPs | 3 |
| Max Number to Keep | 3 |
| Max Number of Paths | 1 |
| Parameters |  |
| Alpha |  |

In model, two prominent route choices for traffic originating and destined to centroid 32 and 33 exists. The following option routes:

Route 1: via Henry Lawson Drive/ Bullecourt Avenue intersection.
Route 2: via Milperra Road/ Ashford Avenue intersection then on to Henry Lawson Drive.
During calibration, traffic management strategies such as forced turn were used to distribute origindestination based traffic on route 1 and route 2 . The traffic management strategies applied in base model are summarised in Table 5-2.

Table 5-2: Traffic management strategies adopted.

| Traffic management <br> strategy | O-D Pair | Route 1 | Route 2 |
| :--- | :---: | :---: | :---: |
| AM Period |  |  |  |
| Forced Turn | $5-32$ | $20 \%$ | $80 \%$ |
| Forced Turn | $32-9$ | $100 \%$ | $0 \%$ |
| Forced Turn | $23-5$ | $20 \%$ | $80 \%$ |
| Forced Turn | $32-9$ | $100 \%$ | $0 \%$ |
| PM Period |  |  |  |
| Forced Turn | $5-32$ | $35 \%$ | $65 \%$ |
| Forced Turn | $5-33$ | $35 \%$ | $65 \%$ |
| Forced Turn | $32-9$ | $100 \%$ | $0 \%$ |
| Forced Turn | $32-11$ | $100 \%$ | $0 \%$ |
| Forced turn | $32-15$ | $100 \%$ | $0 \%$ |
| Forced Turn | $32-31$ | $100 \%$ | $0 \%$ |
| Forced Turn | $32-5$ | $35 \%$ | $65 \%$ |
| Forced Turn | $33-5$ | $35 \%$ | $65 \%$ |
| Forced Turn | $9-32$ | $90 \%$ | $10 \%$ |
| Forced Turn | $11-32$ | $100 \%$ | $0 \%$ |
| Forced Turn | $15-32$ | $100 \%$ | $0 \%$ |
| Forced Turn | $31-32$ | $100 \%$ | $0 \%$ |
| Weekend Period |  |  |  |

| Traffic management <br> strategy | O-D Pair | Route 1 | Route 2 |
| :--- | :---: | :---: | :---: |
| Forced Turn | $5-32$ | $20 \%$ | $80 \%$ |
| Forced Turn | $32-9$ | $100 \%$ | $0 \%$ |
| Forced Turn | $23-5$ | $20 \%$ | $80 \%$ |
| Forced Turn | $32-9$ | $100 \%$ | $0 \%$ |

## 6 Base Model Calibration and Validation

The process of model calibration and validation is a highly iterative process which involves network verification and fine-adjustment of both appropriate model parameters and the origin-destination matrices. The aim of this process is to improve the ability of the model to reproduce observed vehicle / driver behaviour and the match between modelled and observed traffic movements.

Given the range of model parameters affecting vehicle / driver behaviour and iterative nature of calibration and validation, the process was carefully planned and managed

The model calibration and validation results are discussed in the following sections.

### 6.1 Model Stability

As recommended in the Modelling Guidelines, the microsimulation model results have been based on the average of five replications runs with different random seed values. These random seed values recommended in Modelling guidelines and adopted are 560, 28, 7771, 86524 and 2849 for all assessed peak periods.

The overall network statistics in terms of Vehicle Hours Travelled (VHT), Vehicle Kilometres Travelled (VKT), Average Delay, and Number of Vehicles (NV) for the modelled peak hours have been reported in the following sections. These statistics are generally considered representative of the model variability. Additionally, Coefficient of variance ( CoV ) has been calculated for the different statistics. CoV is a measure of variation between model runs and informs on the stability of each of the performance measures. Typically, a CoV within $5 \%$ is considered to have a good level of correlation between model runs and indicates that the model is stable.

### 6.1.1 AM Model Stability Results

Table 6-1 summarises the statistics based on five replications and provides the CoV for the AM peak. CoV results are shown to be than $5 \%$ which indicates that a good level of model stability has been achieved. Stability plots for VHT and VKT are also presented in Figure 6-1 and Figure 6-2 to graphically show the variability.

Table 6-1: Model Stability during AM Peak

| Scenario | Seed | VHT | $\begin{array}{c}\text { \%Diff } \\ \text { from } \\ \text { Average }\end{array}$ | VKT | $\begin{array}{c}\text { \%Diff } \\ \text { from } \\ \text { Average }\end{array}$ | $\begin{array}{c}\text { Number } \\ \text { of Vehicle } \\ \text { Outside } \\ \text { (NV) }\end{array}$ | $\begin{array}{c}\text { \%Diff } \\ \text { from }\end{array}$ |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |

### 6.2 Model Calibration Criteria

The calibration criteria presented below are based on the Traffic Modelling Guidelines (Roads and Maritime Services, 2013):

- GEH < 5 minimum $85 \%$ of observations to be within these tolerance limits and $100 \%$ of observations to be within $\mathrm{GEH}<10$ tolerance limits
- Turn or link flows with GEH > 10 require explanation
- Plots of observed vs modelled hourly flows for all observations and to include lines showing GEH = 5 tolerance limits
- R2 value to be included with plots and to be $>0.9$
- Slope equation to be included with plots

The GEH statistic is used in the calibration of the traffic models to compare the differences between modelled and observed traffic flows. The GEH statistic is defined as:

$$
G E H=\sqrt{\frac{\left(V_{\text {observed }}-V_{\text {Modelled }}\right)^{2}}{0.5 *\left(V_{\text {Observed }}+V_{\text {Modelled }}\right)}}
$$

### 6.3 Traffic Count Calibration

This section summarises the comparisons between observed and modelled traffic counts during the peak hour periods. The information presents the microsimulation results achieved from comparing observed and modelled count data for each of the individual turns. A more detailed outline of the calibration results can be found in Appendix B.

### 6.3.1 AM Model Traffic Count Calibration Results

Table 6-4 and Table 6-5 summarise model calibration results for the weekday during AM peak hours (7:458:45 AM and 8:45-9:45 AM) for both light and heavy vehicles. Figure $6-7$ to Figure $6-10$ show the scatter plots between modelled and observed hourly flows for the above AM peak model periods, respectively.

- During 07:45-08:45 AM and 08:45-09:45 AM, 100 per cent of turn flows have GEH value of less than 10 for both light and heavy vehicles ( $\mathrm{GEH}<10$ ).
- 95.06\% (154 of 162) of all movements during 07:45-08:45 AM and 97.53\% (158 of 162) of all movements during 08:45-09:45 AM for light vehicles have GEH value of less than 5 ( $\mathrm{GEH}<5$ ).
- 92.59\% (150 of 162) of all movements during 07:45-08:45 AM and 93.21\% (151 of 162) of all movements during 08:45-09:45 AM for heavy vehicles have GEH value of less than $5(\mathrm{GEH}<5)$.
- These results are reinforced with a high $R^{2}$ value 0.994 and 0.993 for light vehicles and 0.937 and 0.942 for heavy vehicles, which demonstrates that a high level of calibration was achieved for the weekday AM peak period (07:45-08:45 AM and 08:45-09:45 AM).

Table 6-4 AM turn calibration statistic results for light vehicles

| Network Wide Calibration Criteria | 7:45-8:45 AM | 8:45-9:45 AM | Calibration |
| :---: | :---: | :---: | :---: |
| $85 \%$ of observations must have GEH < 5 | 154 (95.06\%) | 158 (97.53\%) | $\checkmark$ |
| $100 \%$ of observation must have GEH < 10 | 162 (100\%) | 162 (100\%) | $\checkmark$ |
| Total observations | 162 | 162 |  |

Table 6-5 AM turn calibration statistic results for heavy vehicles

| Network Wide Calibration <br> Criteria | $\mathbf{7 : 0 0 - 8 : 0 0 ~ A M ~}$ | 8:00-9:00 AM | Calibration |
| :--- | :---: | :---: | :---: |
| 85\% of observations must <br> have GEH $<5$ | $150(92.59 \%)$ | $151(93.21 \%)$ | $\boldsymbol{V}$ |
| $100 \%$ of observation must <br> have GEH $<10$ | $162(100 \%)$ | $162(100 \%)$ | $\boldsymbol{V}$ |
| Total observations | 162 | 162 |  |

Figure 6-10: 8:45-9:45 AM regression plots for heavy vehicles

### 6.3.2 PM Model Traffic Count Calibration Results

Table 6-6 and Table 6-7 summarise model calibration results for the weekday during PM peak hours (03:3004:30 PM and 04:30-05:30 PM) for both light and heavy vehicles. Figure 6-11 to Figure 6-14 show the scatter plots between modelled and observed hourly flows for the above PM peak model periods, respectively.

- During 03:30-04:30 PM and 04:30-05:30 PM, 100 per cent of turn flows have GEH value of less than 10 for both light and heavy vehicles ( $\mathrm{GEH}<10$ ).
- $98.15 \%$ (159 of 162) of all movements during PM peak for light vehicles have GEH value of less than 5 (GEH<5).
- $96.91 \%$ (157 of 162) of all movements during 03:30-04:30 PM and 97.53\% (158 of 162) of all movements during 04:30-005:30 PM for heavy vehicles have GEH value of less than 5 (GEH<5).
- These results are reinforced with a high $R^{2}$ value 0.993 and 0.991 for light vehicles and 0.943 and 0.931 for heavy vehicles, which demonstrates that a high level of calibration was achieved for the weekday PM peak period (3:30-4:30 PM and 4:30-5:30 PM).

Table 6-6 PM turn calibration statistic results for light vehicles

| Network Wide Calibration <br> Criteria | 3:30-4:30 PM | 4:30-5:30 PM | Calibration |
| :--- | :---: | :---: | :---: |
| $85 \%$ of observations must <br> have GEH < | $159(98.15 \%)$ | $159(98.15 \%)$ | $\boldsymbol{V}$ |
| $100 \%$ of observation must <br> have GEH $<10$ | $162(100 \%)$ | $162(100 \%)$ | $\boldsymbol{V}$ |
| Total observations | 162 | 162 |  |

Table 6-7 PM turn calibration statistic results for heavy vehicles

| Network Wide Calibration Criteria | 3:30-4:30 PM | 4:30-5:30 PM | Calibration |
| :---: | :---: | :---: | :---: |
| $85 \%$ of observations must have GEH < 5 | 157 (96.91\%) | 158 (97.53\%) | $\checkmark$ |
| $100 \%$ of observation must have GEH < 10 | 162 (100\%) | 162 (100\%) | $\checkmark$ |
| Total observations | 162 | 162 |  |

### 6.3.3 Weekend Model Traffic Count Calibration Results

Table 6-8 and Table 6-9 summarise model calibration results for the weekend peak hours (11:30 AM - 12:30 PM and 12:30 PM - 01:30 PM) for both light and heavy vehicles. Figure 6-15 to Figure 6-18 show the scatter plots between modelled and observed hourly flows for the above weekend peak model periods, respectively.

- During 11:30 AM - 12:30 PM and 12:30 PM - 01:30 PM, 100 per cent of turn flows have GEH value of less than 10 for both light and heavy vehicles (GEH <10).
- For light vehicles, 100\% of all movements during 11:30 AM-12:30 PM and 12:30 PM - 01:30 PM have GEH value of less than $5(\mathrm{GEH}<5)$.
- In case of heavy vehicles, 93.21\% (151 of 162) of all movements during 11:30 AM - 12:30 PM and $95.68 \%$ (155 of 162 ) of all movements during 12:30 PM - 01:30 PM have GEH value of less than 5 ( $\mathrm{GEH}<5$ ).
- These results are reinforced with a R² value 0.997 and 0.997 for light vehicles and 0.869 and 0.892 for heavy vehicles, which demonstrates that a good level of calibration was achieved for the weekend peak period (11:30 AM - 12:30 PM and 12:30 PM - 01:30 PM).

Table 6-8: Weekend turn calibration statistic results for light vehicles

| Network Wide Calibration <br> Criteria | 11:30 AM - 12:30 PM | 12:30 PM - 01:30 PM | Calibration |
| :--- | :---: | :---: | :---: |
| $85 \%$ of observations must <br> have GEH < 5 | $162(100 \%)$ | $162(100 \%)$ | $\boldsymbol{V}$ |
| $100 \%$ of observation must <br> have GEH $<10$ | $162(100 \%)$ | $162(100 \%)$ | $\boldsymbol{V}$ |
| Total observations | 162 | 162 |  |

Table 6-9: Weekend turn calibration statistic results for heavy vehicles

| Network Wide Calibration <br> Criteria | 11:30 AM - 12:30 PM | 12:30 PM - 01:30 PM | Calibration |
| :--- | :---: | :---: | :---: |
| 85\% of observations must <br> have GEH $<5$ | $151(93.21 \%)$ | $155(95.68 \%)$ | $\boldsymbol{V}$ |
| $100 \%$ of observation must <br> have GEH $<10$ | $162(100 \%)$ | $162(100 \%)$ | $\boldsymbol{V}$ |
| Total observations | 162 | 162 |  |

### 6.4 Model Validation

Model validation involves the comparison of observed and modelled traffic behaviour for datasets that are independent to the datasets used for the model calibration. Model validation is necessary to ensure that a model accurately represents an existing traffic situation and can be used with confidence to test alternatives.

### 6.4.1 Model Validation Criteria

Based on the Traffic Modelling Guidelines (Roads and Maritime, 2013), the average modelled journey time to be within 15 per cent or one minute (whichever is greater) of average observed journey time for full length of the route.

### 6.4.2 Network Parameter Modifications

As part of the travel time validation process, the following network parameters were modified from the TfNSW previously developed model and few network parameters were adopted for extension portion:

- During AM period
- The acceleration factor from Bullecourt Avenue to Keys Parade Northbound has been increased by 2 times, acceleration factor for south approach and east-bound approach to HLD/Bullecourt Avenue intersection has been increased by 3 and acceleration factor from HLD/ M-5 intersection to Fromelles Avenue has been increased by 1.5 .
- For Flinders Road to Milperra Road the acceleration factor has been increased by 2 times, however for the portion between north approach of Beale Street to Endeavour Road the acceleration factor has been increased by 3 times. Similarly, the acceleration factor for (2 lane section) North approach to tower Road has been increased by 3 times.
- The acceleration factor for South bound from Milperra to M-5 has been increased by 2 times except for the two-lane section between Milperra Road to Auld Avenue and Keys Parade to Raleigh Road.
- During PM period
- In Northbound, the acceleration factor from Pozieres Avenue to Milperra has been increased by 2 times except for the portion between Keys Parade to Auld Avenue. For south approach and East bound approach of Bullecourt/HLD intersection, the acceleration factor has been increased by 3 times.
- In South bound, the acceleration factor from Flinders Road to Milperra has been reduced by 0.5 times except for the portion between Haig Avenue to Georges golf course and Tower Road south bound approach for which acceleration factor has been reduced by 0.2 times.
- The acceleration factor for East bound and West bound approach for HLD/ Milperra intersection has been increased by 3 times. The acceleration factor for the reaming portion of West bound section on Newbridge Road and Milperra road has been increased by 2 times.
- During Weekend period
- The acceleration factor for northbound and southbound between M5 and Flinders Road has been increased by 5 times.
- For Milperra Road, an acceleration factor of 5 was used for both eastbound and westbound.
- Based on midblock survey conducted by Matrix in 2022, the section between M-5 and Bullecourt Avenue had an $85^{\text {th }}$ percentile speed of approximately $70 \mathrm{~km} / \mathrm{h}$. Therefore, attribute override was created to reflect the $85^{\text {th }}$ percentile speed for that section in the model for weekend.
The parameter changes on the AM, PM and weekend peak scenarios were added as Attribute Overrides.

### 6.4.3 Validation Results for AM Model

The modelled travel times along Henry Lawson Drive have been validated against HERE travel time data for two hours, 07:45-08:45 AM and 08:45-09:45 AM. It should be noted that traffic count data used for calibration purposes is from 2018 and 2022; however, travel time data used during the validation process was collected in 2018. These differences in data collection year may result in discrepancies between the surveyed data, which might impact modelled results.

Figure 6-19 to Figure 6-22 and Table 6-10 present travel time results for the morning peak. Overall, the modelled and HERE travel time data show a good correlation and fit within the $15 \%$ range or one minute for northbound section except for southbound section which has travel time difference of 1:33 minutes during 07:45-08:45 AM and travel time difference of $1: 50$ minutes during 08:45 to 09:45 AM. Based on the fact that calibration and validation data were obtained for different dates and that the total travel time difference is within two minutes for the entire corridor, it can be considered that modelled travel times are a good representation of what was observed on site.

Table 6-10: Travel Time Validation Northbound and Southbound during AM Peak

| Travel Route | Direction | Time | Observed (mm:ss) | Modelled (mm:ss) | Abs Diff (mm:ss) | Rel Diff \% | Result |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| M5-Flinders Road | Northbound | 07:45-08:45 AM | 08:26 | 08:20 | 00:06 | 1\% | PASS |
| M5-Flinders Road | Northbound | 08:45-09:45 AM | 10:43 | 09:56 | 00:47 | 7\% | PASS |
| Flinders Road-M5 | Southbound | 07:45-08:45 AM | 07:37 | 09:11 | 01:33 | 20\% | FAIL |
| Flinders Road-M5 | Southbound | 08:45-09:45 AM | 07:03 | 08:53 | 01:50 | 26\% | FAIL |
| Travel Time Criteria and measure |  | Criteria | Observed Total |  | Modelled Achieved | Achiev ed | Result |
| $\pm 15 \%$ or one minute (whichever is greater) of average of full length of routes |  | $\geq 95 \%$ of cases | 2 |  | 2 | 100\%* | PASS |

Figure 6-19: Travel time validation northbound 7:45-8:45 AM

Figure 6-20 Travel time validation northbound 8:45-9:45 AM

Figure 6-21: Travel time validation southbound 7:45-8:45 AM

Figure 6-22: Travel time validation southbound 8:45-9:45 AM

### 6.4.4 Validation Results for PM Model

The modelled travel times along Henry Lawson Drive have been validated against HERE travel time data for two hours, 03:30-04:30 PM and 04:30-05:30 PM. It should be noted that traffic count data used for calibration purposes is from 2018 and 2022; however, travel time data used during the validation process was collected in 2018. These differences in data collection year may result in discrepancies between the surveyed data, which might impact modelled results.

Figure 6-23 to Figure 6-26 and Table 6-11 present travel time results for the evening peak. Overall, the modelled and HERE travel time data show a good correlation and fit within the $15 \%$ range or one minute for all analysed sections, satisfying the validation criteria.

Table 6-11: Travel Time Validation Northbound and Southbound during PM Peak

| Travel Route | Direction | Time | Observed (mm:ss) | Modelled (mm:ss) | Abs Diff (mm:ss) | Rel Diff \% | Result |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| M5-Flinders Road | Northbound | 03:30-04:30 PM | 09:30 | 08:17 | 01:13 | 13\% | PASS |
| M5-Flinders Road | Northbound | 04:30-05:30 PM | 07:57 | 08:50 | 00:52 | -11\% | PASS |
| Flinders Road-M5 | Southbound | 03:30-04:30 PM | 11:15 | 10:23 | -00:52 | 8\% | PASS |
| Flinders Road-M5 | Southbound | 04:30-05:30 PM | 10:42 | 11:27 | -00:45 | -7\% | PASS |
| Travel Time Criteria and measure |  | Criteria | Observed Total |  | Modelled Achieved | Achieved | Result |
| $\pm 15 \%$ or one minute (whichever is greater) of average of full length of routes |  | $\geq 95 \%$ of cases | 2 |  | 2 | 100\%* | PASS |

Figure 6-24: Travel time validation northbound 4:30-5:30 PM

Figure 6-25: Travel time validation southbound 3:30-4:30 PM

Figure 6-26: Travel time validation southbound 4:30-5:30 PM

### 6.4.5 Validation Results for Weekend Model

The Modelled travel times along Henry Lawson Drive have been validated against HERE travel time data for two hours, 11:30 AM - 12:30 PM and 12:30 PM - 01:30 PM. It should be noted that traffic count data used for calibration purposes is from 2021 and 2022; however, travel time data used during the validation process was collected in 2018. These differences in data collection year may result in discrepancies between the surveyed data, which might impact modelled results.

Figure 6-27 to Figure 6-30 and Table 6-12 present travel time results for the morning peak. Overall, the modelled and HERE travel time data show a correlation, however, not within the $15 \%$ range or one minute for the northbound and southbound sections. For the northbound, there is a travel time difference of 01:40 minutes during 11:30 AM - 12:30 PM and travel time difference of 1:15 minutes during 12:30 PM - 01:30 PM. In the case of southbound, there is a travel time difference of 01:34 minutes during 11:30 AM - 12:30 PM and travel time difference of 2:18 minutes during 12:30 PM - 01:30 PM.
Since the calibration and validation data were obtained for different dates and that the total travel time difference is within two minutes for the entire corridor, it can be considered that modelled travel times are a good representation of what was observed on site.

Table 6-12: Travel Time Validation Northbound and Southbound during AM Peak

| Travel Route | Direction | Observed <br> (mm:ss) | Modelled <br> (mm:ss) | Abs Diff <br> (mm:ss) | Rel Diff \% | Result |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| M5-Flinders <br> Road | Northbound | $11: 30$ AM-12:30 PM | $06: 10$ | $07: 50$ | $01: 40$ | $27 \%$ | FAIL |
| M5-Flinders <br> Road | Northbound | $12: 30$ PM-01:30 PM | $06: 47$ | $08: 01$ | $01: 15$ | $18 \%$ | FAIL |
| Flinders Road- <br> M5 | Southbound | $11: 30$ AM-12:30 PM | $07: 01$ | $08: 35$ | $01: 34$ | $22 \%$ | FAIL |
| Flinders Road- <br> M5 | Southbound | $12: 30$ PM-01:30 PM | $06: 18$ | $08: 36$ | $02: 18$ | $36 \%$ | PASS |

Figure 6-30: Travel time validation southbound 12:30 PM - 01:30 PM

### 6.5 Intersection Level of Service

This section provides simulated Level of Services (LOS) across the modelled time periods at 15 key intersections in the modelled area. Detailed results are presented in Appendix C.

The key indicator of intersection performance level of service (LOS) is delay, where results are ranked on a scale from A to F as shown in Table 6-13 (Traffic Modelling Guidelines, 2013). As intersections become more congested, the delay increases, reducing the intersection LOS towards F. It should be noted that LOS F starts when the average delay reaches $70 \mathrm{sec} / \mathrm{veh}$ and does not register as anything worse than LOS F even though the delay may increase to two or three times this value. For traffic signals, the average movement delay and level of service over all movements is considered.

Table 6-13 Level of service criteria in accordance with RMS Traffic Modelling Guidelines

| Level of <br> service | Average delay per <br> vehicle (s) | Traffic Signal, Roundabouts | Give way and stop signs |
| :---: | :---: | :---: | :---: |
| A | $<14$ | Good operation | Good operation |
| B | 15 to 28 | Good with acceptable delays \& spare capacity | Acceptable delays \& spare capacity |
| C | 29 to 42 | Satisfactory | Satisfactory, but accident study <br> required |
| D | 43 to 56 | Operating near capacity | Near capacity \& accident study <br> required |
| E | 57 to 70 | $>70$ | At capacity, at signals, incidents will cause |
| excessive delays | At capacity, requires other control <br> mode |  |  |
| F |  | Unsatisfactory and requires additional capacity | Unsatisfactory and requires additional <br> capacity |

### 6.5.1 AM Model Intersection Level of Service

The LOS has been analysed during 07:45-08:45 AM and 08:45-09:45 AM respectively, at 15 key intersections. Table 6-14 presents a LOS summary of these 15 key intersections during the weekday AM Peak period, whilst a detailed output is presented in Appendix C.

Table 6-14 AM Peak Intersection Level of Service Summary

| ID | Intersection | 07:45-08:45 AM |  |  | 08:45-09:45 AM <br> Intersection |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |  |  |  |
|  |  | Volume | Delay (s) | LOS | Volume | Delay (s) | LOS |
| 1 | HLD/ Haig Avenue | 2,404 | 33 | C | 2,142 | 34 | C |
| 2 | HLD / Tower Road | 2,833 | 26 | B | 2,601 | 55 | D |
| 3 | HLD / Milperra Road | 5,771 | 228 | F | 5,556 | 591 | F |
| 4 | HLD/ Auld Avenue | 2,101 | 6 | A | 1,975 | 6 | A |
| 5 | HLD / Keys Parade | 1,995 | 12 | A | 1,992 | 16 | B |
| 6 | HLD/ Raleigh Road | 1,985 | 5 | A | 1,742 | 5 | A |
| 7 | HLD/ Ruthven Avenue | 1,867 | 3 | A | 1,655 | 3 | A |
| 8 | HLD/ Whittle Avenue | 1,880 | 3 | A | 1,647 | 3 | A |
| 9 | HLD/ Amiens Avenue | 1,919 | 4 | A | 1,694 | 3 | A |
| 10 | HLD/ Bullecourt Avenue | 2,298 | 25 | B | 2,030 | 25 | B |
| 11 | HLD/ Fromelles Avenue | 2,018 | 8 | A | 1,726 | 7 | A |
| 12 | HL / Hermies Avenue | 2,043 | 4 | A | 1,757 | 3 | A |
| 13 | HLD/ Pozieres Avenue | 2,279 | 17 | B | 2,004 | 17 | B |
| 14 | Murray Jones Drive/ Milperra Road | 2,976 | 4 | A | 2,883 | 19 | B |
| 15 | Ashford Avenue / Milperra Road | 3,382 | 35 | C | 3,282 | 52 | D |

- Henry Lawson Drive / Keys Parade/ Flower power:
- In the first AM peak hour from 07:45 AM to 08:45 AM, the intersection operates at LOS A with an intersection delay of 12 seconds, and in the second peak hour from 08:45 AM to 09:45 AM, the intersection operates at LOS B with an intersection delay of 16 seconds indicating a good level of service.
- The demand on Henry Lawson Drive northbound and southbound is high. Figure 6-31 presents the typical intersection operation at Henry Lawson Drive / Keys Parade/Flower power intersection.

## 08:32:19

Figure 6-31 : Henry Lawson Drive / Keys Parade / Flower power Weekday AM peak operation screenshot.

## - HLD / Bullecourt Avenue:

- During the AM peak period from 7:45 AM to 9:45 AM, the intersection operates at LOS B with intersection delay of 25 seconds in both peak hours, indicating good level of performance. The traffic demand on northbound, southbound, and eastbound (turning into Bullecourt Avenue) is high which creates a small and short-lasting queue at each approach of the intersection. The model suggests that the queues on all approaches mostly get dissipated during green time for that approach. The users going northbound to Henry Lawson Drive from Bullecourt Avenue in the east approach face the most delay. The existing delay on Bullecourt Avenue is 68 seconds.
- The Figure 6-32 presents Henry Lawson Drive/ Bullecourt Avenue intersection operation during AM peak in comparison to google typical traffic volume view during AM peak on weekday. Upon comparison, it is seen that the short queues at intersection approaches were captured.

## 08:23:47

Figure 6-32 : Henry Lawson Drive/ Bullecourt Ave Weekday AM Peak Intersection operation screenshot

- HLD / Pozieres Avenue:
- During AM peak period, the intersection operates at LOS B with intersection delay of 17 seconds in both hours. The model suggests the users turning from Pozieres Avenue into Henry Lawson Drive may face some delay. The delay for users from Pozieres Avenue is 68 seconds.

### 6.5.2 PM Model Intersection Level of Service

The LOS has been analysed during 3:30-4:30 PM and 4:30-5:30 PM respectively, at 15 key intersections. Table 6-15 presents a LOS summary of these 15 key intersections during the weekday PM Peak period while a detailed output is presented in Appendix C.

Table 6-15: PM Peak Intersection Level of Service Summary

| ID | Intersection | 3:30-4:30 PM |  |  | 4:30-5:30 PM |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Intersection |  |  | Intersection |  |  |
|  |  | Volume | Delay | LOS | Volume | Delay | LOS |
| 1 | HLD/ Haig Avenue | 2,408 | 55 | D | 2,476 | 57 | E |
| 2 | HLD / Tower Road | 2,976 | 35 | C | 3,135 | 37 | C |
| 3 | HLD / Milperra Road | 6,545 | 237 | F | 6,871 | 469 | F |
| 4 | HLD/ Auld Avenue | 2,221 | 7 | A | 2,363 | 8 | A |
| 5 | HLD / Keys Parade | 2,209 | 14 | A | 2,358 | 17 | B |
| 6 | HLD/ Raleigh Road | 2,033 | 5 | A | 2,052 | 5 | A |
| 7 | HLD/ Ruthven Avenue | 1,939 | 3 | A | 1,930 | 3 | A |
| 8 | HLD/ Whittle Avenue | 1,959 | 3 | A | 1,943 | 3 | A |
| 9 | HLD/ Amiens Avenue | 2,015 | 3 | A | 1,989 | 3 | A |
| 10 | HLD/ Bullecourt Avenue | 2,355 | 45 | D | 2,342 | 38 | C |
| 11 | HLD/ Fromelles Avenue | 1,972 | 6 | A | 1,982 | 5 | A |
| 12 | HL / Hermies Avenue | 2,109 | 5 | A | 2,087 | 4 | A |
| 13 | HLD/ Pozieres Avenue | 2,272 | 12 | A | 2,253 | 11 | A |
| 14 | Murray Jones Drive/ Milperra Road | 3,578 | 6 | A | 3,342 | 16 | B |
| 15 | Ashford Avenue / Milperra Road | 4,019 | 18 | B | 3,698 | 20 | B |

- HLD / Keys Parade/Flower power:
- During the PM peak period from 03:30 PM to 4:30 PM, the intersection operates at LOS A with an intersection delay of 14 seconds and in the second peak hour from 04:30 PM to 05:30 PM, the intersection operates at LOS B with an intersection delay of 17 seconds indicating a good level of service.
- During PM, the demand for traffic turning from Henry Lawson Drive into Flower Power Access and demand for traffic turning from Flower Power Access into Henry Lawson Drive is higher. Also, the demand on Henry Lawson Drive northbound and southbound is high. The delay for Flower Power Access in the east approach from 03:30 PM to 4:30 PM is 44 seconds and for 04:30 PM to 05:30 PM is 43 seconds. Figure $6-33$ presents the intersection operation at Henry Lawson Drive/ Keys Parade/ Flower power intersection.

## 15:48:52

Figure 6-33: Henry Lawson Drive / Keys Parade/Flower power Weekday PM peak operation screenshot.

- HLD / Bullecourt Avenue:
- During the first PM peak hour from 03:30 PM to 04:30 PM, the intersection operates at LOS D with an intersection delay of 45 seconds and in the second peak hour from 04:30 PM to 05:30 PM, the intersection operates at an improved LOS C with an intersection delay of 38 seconds.
- In the PM peak period, the demand from Bullecourt Avenue turning into Henry Lawson Drive increases considerably resulting in congestion on the approach. The average delay on Bullecourt Avenue east approach from 03:30 PM to 04:30 PM is 112 seconds and from 04:30 PM to 05:30 PM is 92 seconds. The high delay on Bullecourt Avenue approach leads to comparatively higher overall intersection delay and hence an overall LOS D. The Figure 6-34 presents the operation of Henry Lawson Drive/ Bullecourt Avenue intersection in PM peak in comparison to google typical traffic view during PM peak on a typical weekday. Upon comparison of images, it is seen that the increased length of queues at Bullecourt Avenue approach were captured.

16:31:09

Figure 6-34: Henry Lawson Drive/ Bullecourt Ave Weekday PM Peak Intersection operation screenshot

- HLD / Pozieres Avenue:
_ During the PM peak period from 03:30 PM to 05:30 PM, the intersection operates at LOS A indicating a good level of performance. The model suggests the users turning from Pozieres Avenue into Henry Lawson Drive may face some delay. The delay for vehicles from Pozieres Avenue is 51 seconds.

### 6.5.3 Weekend Model Intersection Level of Service

The LOS has been analysed during 11:30 AM-12:30 PM and 12:30 PM-01:30 PM respectively, at 15 key intersections. Table 6-16 presents a LOS summary of these 15 key intersections during the weekend peak period, whilst a detailed output is presented in Appendix C.

Table 6-16: Weekend Peak Intersection Level of Service Summary

| ID | Intersection | 11:30 AM - 12:30 PM |  |  | 12:30 PM - 01:30 PM |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Intersection |  |  | Intersection |  |  |
|  |  | Volume | Delay (s) | LOS | Volume | Delay (s) | LOS |
| 1 | HLD/ Haig Avenue | 2,339 | 32 | C | 2,407 | 34 | C |
| 2 | HLD / Tower Road | 2,779 | 22 | B | 2,880 | 25 | B |
| 3 | HLD / Milperra Road | 5,964 | 55 | D | 5,858 | 102 | F |
| 4 | HLD/ Auld Avenue | 2,250 | 6 | A | 1,997 | 5 | A |
| 5 | HLD / Keys Parade | 2,303 | 17 | B | 2,075 | 17 | B |
| 6 | HLD/ Raleigh Road | 1,706 | 3 | A | 1,532 | 3 | A |
| 7 | HLD/ Ruthven Avenue | 1,589 | 3 | A | 1,445 | 2 | A |
| 8 | HLD/ Whittle Avenue | 1,585 | 3 | A | 1,441 | 3 | A |
| 9 | HLD/ Amiens Avenue | 1,613 | 3 | A | 1,468 | 2 | A |
| 10 | HLD/ Bullecourt Avenue | 1,792 | 24 | B | 1,601 | 23 | B |
| 11 | HLD/ Fromelles Avenue | 1,673 | 5 | A | 1,625 | 5 | A |
| 12 | HL / Hermies Avenue | 1,931 | 4 | A | 1,785 | 4 | A |
| 13 | HLD/ Pozieres Avenue | 2,111 | 13 | A | 1,949 | 12 | A |
| 14 | Murray Jones Drive/ Milperra Road | 3,179 | 3 | A | 3,128 | 4 | A |
| 15 | Ashford Avenue / Milperra Road | 3,482 | 23 | B | 3,449 | 52 | D |

- Henry Lawson Drive / Keys Parade / Flower power:
- In the first weekend peak hour from 11:30 AM - 12:30 PM, the intersection operates at LOS B with an intersection delay of 17 seconds, and in the second peak hour from 12:30 PM - 01:30 PM, the intersection operates at LOS B with an intersection delay of 17 seconds indicating a good level of service.
- HLD / Bullecourt Avenue:
- During the weekend peak period from 11:30 AM - 01:30 PM, the intersection operates at LOS B in both peak hours, indicating a good level of performance. The traffic going northbound, southbound, and eastbound (turning into Bullecourt Avenue) creates a small and short-lasting queue at each approach of the intersection. The model suggests that the queues on all approaches mostly get dissipated during green time for that approach. The users going northbound to Henry Lawson Drive from Bullecourt Avenue in the east approach face the most delay. The existing delay on Bullecourt Avenue (east approach is) is 61 seconds.
- HLD / Pozieres Avenue:
- During weekend peak period, the intersection operates at LOS A in both hours. The model suggests the users turning from Pozieres Avenue into Henry Lawson Drive may face some delay. The delay for users from Pozieres Avenue is 59 seconds.

## 7 Summary and Conclusions

Aurecon was engaged by TfNSW to develop a microsimulation corridor model of Henry Lawson Drive upgrade - Stage 1 B area. This model is intended to be used to analyse potential future road network upgrade options being investigated for the area to relieve congestion and improve capacity. The model has been developed in Aimsun and calibrated to 2022 traffic conditions.

This report has been prepared to document the Base Model calibration and validation outcomes during AM, PM and weekend peak periods. The Base Model calibration and validation results along with observation of the model runs indicate that the model shows a good representation of the 2022 traffic conditions.

In summary, the Base Model adheres to all the criteria mandated by the Traffic Modelling Guidelines (Roads and Maritime, 2013) for calibration and validation, except during the weekend peak period where validation criteria were not satisfied. However, since the calibration and validation data were obtained for different years and that the total travel time difference is within two minutes for the entire corridor, it can be considered that modelled travel times are a good representation of what was observed on site.

The model stability is consistent across all chosen 5 seed runs.
Overall, the model is representative of the existing traffic conditions within the study area and is therefore considered fit for purpose to be used as the basis for option analysis.
