Procedural Guideline

ILC-ITS-TP0-002-G13

Introduction

This guideline is intended to complement procedure ILC-ITS-TP0-002 which is a generic description of processes for installation of Intelligent Transport System devices and systems.

When working on an installation of Closed Circuit Camera Television camera (CCTV) systems it is advisable to refer to both documents to provide the minimum installation information required.

Description of Device

Closed Circuit Television Camera Systems (CCTVs) are of fundamental importance in traffic management and planning.

There are approximately 1600 CCTVs in use throughout NSW motorways— these include a combination of standard analog and web cameras. Monitoring offices control the cameras and are present in both metropolitan and regional areas.

The Transport Management Centre (TMC) is the main operator followed by the regional offices such as in Newcastle and Woy Woy. The TMC has approximately 32 operators who monitor CCTV camera feeds – respond to incidents accordingly.

Various agencies share information gained from the CCTVs and camera feeds for the purpose of incident management, enforcement, emergency management, and major events management, these include:

- NSW Police
- Sydney Rail Railways
- State Emergency Services
- Sydney Olympic Park
- City of Sydney
- Private Motorway Operators

Optical fibre communication is used as the main transport medium from the CCTV camera transmitter to the TMC, majority of this network is owned by Roads and Maritime Services. ADSL communication medium as a broadband service is also used to transmit the video feeds to TMC in cases where Fibre Optics cannot be used.

On the field where analogue cameras are used, the video feed is digitalised using digital video encoders compliant with MPEG 2, MPEG 4 (part 2 and part 10) and MJPEG standards enable high-quality video to be transmitted over the network.

Information of the two different categories of cameras used is given below:

Printed copies of this document are uncontrolled

This document is authorised on the register of procedures

- Web Cameras: This category of cameras transmit JPEG snapshots of the live traffic to an FTP server. Images are available to public to monitor traffic conditions using LiveTraffic website. The video is viewed at CIF resolution at approximately 1fps.
- Standard Cameras: The video feeds from these cameras are used for monitoring road transport and incident management. The video is viewed at 4CIF at approximately 25fps.

The cameras are procured commercial-off-the-shelf (COTS) and installed in consultation with the client and the infrastructure (e.g. Routers switches etc.) for the retrieval of the camera feeds is managed by Roads and Maritime Services.

At present the TMC use analog Video Control System (VCS). The VCS, which controls the cameras and assists in the administration is expected to be upgraded to a digital base system by end of 2014.

Operating and Maintenance Manual

Refer to Operating and Maintenance Manuals provided by Supplier(s).

About this release

Guideline Number:	ILC-ITS-TP0-002-G13
Guideline Title:	Closed Circuit Television Systems
Author:	Ray Treuer Peter Krakovsky
Technical Authorities	Network Operations TMC Systems

Issue	Date	Revision description
Issue 1	July 2013	Initial Release
Issue 2	September 2013	Updated author and technical authority
Issue 3	November 2013	Updated title
Issue 4	January 2014	Sorted definitions section
Issue 5	March 2015	New Template and logo. Updated References and Related Documents.

Note: The issue date is normally considered to be the date on which a document is authorised or signed off. Under the ILC Management System, authorisation is indicated by the signature of the authorising manager on the document register. For simplicity then, the date of writing or revising a document is used as the issue date.

This document is published under the Infrastructure Life Cycle Management System and is subject to review and continual improvement. The current version of this procedure is that published on the Roads and Maritime Services intranet.

Note: The Infrastructure Lifecycle Management System complies with the requirements of the ISO9001 standard. This standard is revised every four years (2008, 2012, 2016). While system procedures within the ILC Management System are revised as necessary, to meet any changed requirements of the standard, references within the procedures refer only to ISO9001.

It should be confidently assumed by users that the term ISO9001 within a procedure refers to the most current version of the standard.

HAVE YOUR SAY!

TechInfo welcomes your feedback, ideas, suggestions and constructive comments. If you have any concerns about specifications or other Roads and Maritime Services technical documents, using our Improvement Requests system will allow your suggestions to be referred to the person responsible even quicker.
